1. Welcome

Yahoo group: mkars80
Date: 2007-06-11 21:27:39 UTC
From: Steve Drury
Topic: 1 Message: 1

All group members local and distant.....

I would like to welcome all to this group which has been set up to assist those having problems with construction, show prospective builders what the MKARS80 is and give users ideas for enhancements or modifications.

Already I'm aware of several enhancements:
Slow motion drive
SWR meter
ATU

One significant enhancement I have planned but not yet fully designed is a DDS oscillator with an on-board CW generator, the MKARS has several keen CW enthusiasts! It is planned that the board will plug into the micro socket with a few flying leads to attach for connectivity... more later once it is proven.

Anyway, please let me have any photos or links you think appropriate (your own rig or enhancements); these can be uploaded for approval via the file or photo areas. In the next few days I will upload pictures of my prototypes and all the documentation.

Please visit the MKARS club website at www.mkars.org.uk

Hello,

Just to introduce myself, my name is John call sign M0TIF. I have already built the MKARS80 and to date had 107 nice QSO's on it best DX so far is CT1 (Portugal) using a W3DZZ trap dipole.

See photo section for a few pictures of my MKARS80 and a small ATU I made to compliment it. Currently working on an LED SWR meter to fit inside the ATU so as to have as few boxes as possible when /P operation.

Anil,

Yes but not in a holder, also you won't be able to fit a speaker in. The radio has been designed with ALL connections along the back edge so it is easy to fit in alternative cases.

Steve G6ALU

Parts have now been received for the second batch of PCBs, all we need to do now is kit them!

Charlie (MoAIJ) has made up a battery box for his using the same metal box as the radio.

If you have any pictures Charlie I can put them in the Photo section.

7. Changes to MKARS80 and new version of manual for next batch of kits

Yahoo group: mkars80
Date: 2007-06-15 16:44:31 UTC
From: Steve drury
Topic: 7 Message: 7

Prospective builders
I now have the components for the next batch of kits but have had to order substitutes for the 8pF (now 10pF) capacitors and 8.2uH (now 10uH) inductors. These changes have little effect on the operation of the radio.

A new version of the manual will be released incorporating these changes, all bag labels will indicate the correct version of the manual to use - for builders of the first batch of kits the existing manual version V1.0 will still be available.

I know having two different manuals may be confusing but this is less "messy" than sending notes in the bags indicating that some components had been substituted.

Please don't get confused between versions of manual, software and PCB - they all carry unrelated version numbers.

Builders of the current kit
Are there any improvements I can make or errors I should correct in the current manual to help future builders - I have corrected the voltage table (incorrect voltages on IC1).

Thanks,
Steve G6ALU

8. MKARS on 40?

Yahoo group: mkars80
Date: 2007-06-20 14:01:35 UTC
From: anil_k_raj
Topic: 8 Message: 8

Steve, after looking at the circuit , I see that the only frequency dependent components (apart from the VFO of course) are the low-pass filter and the pre-driver filter. I am wondering if the design can be pressed into service on 40 by changing these to 7MHz and changing the VFO values to run it at 3MHz instead? With the addition of a few components, the builder could have the flexibility to construct either a 80m or 40M version.

The front-end attenuator that you've added in the design is as relevant at 40M and should be effective against strong broadcast signals from the adjacent frequencies.

Apologies in advance if I am completely off-side.
Anil

9. Re: MKARS on 40?

From: Steve drury
Topic: 8 Message: 9

Anil,

Thinking about it the only issue I can see is the second harmonic of
the highest VFO frequency - 6Mhz - is very close to the wanted
frequency and may not be filtered properly by the BPF.

I will need to build one to check.

From: David White
Topic: 8 Message: 10

hello steve, the suggestion to turn it into a MKARS40 whilst tecnically feasible would i am sure be a disapointment to everyone. its ok trying to use QRP CW on 35 kc/s of 40M but trying to cram in QRP SSB would be a voice in the wilderness. other stations would simply not hear you in the high power melee that goes on in 40M. but it would be a great idea for a CW rig as there is a QRP slot there. no AGC is a definite benefit with CW. well thats my twopenny halpenny worth. i expect i will be shot down in flames though hehehehehe de G3ZPA

Steve,

Yes, you're right of course. The vfo fundamental as well as the second harmonic would now be within the passband of a low-pass filter and perhaps close enough to desensitize. However, the diode ring is pretty robust and it would be interesting to try it out to see how it behaves!

Anil,

No problem with the VFO fundamental (2.7 - 3MHz) as it would be filtered by the BPF.

The idea of the MKARS80 was to offer something to club members to build and get them into the "building spirit", this seems to have worked as the little radios have spawned homebrew SWR meters etc.

As the aim of the project has been met I've moved on to other designs but anyone is welcome to develop the MKARS80 and I will be available to test a prototype to ensure it doesn't transmit any "nastys".

Hi Anil,

Yes there are kits available from round 2, costs are:

Kit to MKARS members £35
Kit to NON members £40
Undrilled case £5
Postage UK £3
Postage EU £4
Postage zones 1 and 2 (USA etc) £6

I prefer to send kits with a box as the components fit neatly inside and are protected. If you are interested in a kit please contact me re payment options, plese DO NOT send me cheques drawn on a non UK bank as I can't cash them!

From: ter753
Topic: 22 Message: 22

Hi everyone!, just finished my MKARS 80 this evening. It worked first time.Have only tried it on receive but I am very impressed. Its very quiet and the vfo stability is the best I have ever come across in a free running vfo. The sound quality is first rate. I am very pleased and if anyone is thinking of getting one they should go for it!.This rig has to be the best bargain ever. best 73s, terry lynch EI3IZ.

Terry,

Thanks for the complimentsand I'm glad it worked first time.

You will probably find that the VFO does drift until it has "warmed up", keep an eye on the tunning bar bottom right of the display - if it gets to one of its extremes (normally the left hand side) you will find the VFO will jump in frequency as it loses lock.

Make sure you set up the PA bias as per the instructions then you will find the TX has good sound quality, speak into the microphone so the led momentarily flickers off and you will know the output is correctly modulated.

Perhaps we will hear you on 80M sometime.

Best of luck,
Steve G6ALU

26. An ideal project

Yahoo group: mkars80
Date: 2007-07-09 11:13:40 UTC
From: chas1745
Topic: 26 Message: 26

Steve,

I've just completed the MKARS80 and was delighted that it worked on power-up! I'm now looking forward to setting it up and gaining a full understanding of how it works - no doubt I'll post some daft questions on the forum as I work my way through the circuit diagram!

As someone with no background in electronics (passed the RAE in 1976 but for various reasons didn't pursue amateur radio after 1980)I was struggling to find a radio related project to help with self-education - what is more to the point I know many newcomers to amateur radio are in the same position.

Full blown 'homebrew', 'ugly' builds, 'etch your own', 'source your own with intelligent substitution of obsolete parts' are serious obstacles to the beginner - in my recent experience something not well understood by many project owners, some of whom perhaps see these things as a right of passage. Again I know of many projects that have been abandoned, some before any actual build commenced, for one or other of the above reasons.

The benefits of a professionally produced, silk-screened pcb, a comprehensive manual (with change control)and well thought out build sequence made this kit a pleasure to build with a greatly enhanced probability of first time working.

In my opinion there is no greater pleasure than using something you made yourself, however, homebrew in amateur radio is obviously far less common nowadays - kits like the MKARS80 are exactly what is needed to reverse this trend.

With this early success I am now encouraged to move on, learn, take on more complex builds and hopefully develop the skills mentioned earlier.

I look forward to your next design.

Charles G4IEG

p.s. My old eyes are failing - one suggestion, the circuit diagram as a bi-fold, i.e. over two A4 pages, in the manual would be ideal for me?

28. Slow motion drive

Yahoo group: mkars80
Date: 2007-07-26 10:06:47 UTC
From: John
Topic: 28 Message: 28

I have just fitted the slow motion drive to the main tune control on the MKARS80 originally suggested by Frank M0JSZ.

It works very well see picture in photo section. This drive is available from Mainline Electronics www.mainline-group.com part number 6020/2.

The holes for fitting the drive are very small, tapping screws would be ideal but I could not find any small enough. I did manage to get small nuts and bolts and found it reasonably easy with a long pair of tweezers to pass both nuts between the front case and pcb then pass the screw through the front into the nut.

Nice addition to an excellent project.

Its definitely NOT more sensitive than a commercial radio but then it doesn't need to be on 80M, it does often sound better though probably due to the lack of AGC - when the RF gain is set for a comfortable listening volume you don't get noise between overs.

Another reason it may seem clearer is that it is unlikely to suffer from intermodulation, partly due to reasonable signal handling performance and also back again to the lack of AGC; to achieve a comfortable listening volume you reduce ALL signals at source.

thats very interesting steve, a few of the very modern rigs now do not have the facility to disable the AGC, but on the older rigs such as my ancient FR400 i can turn the AGC off, so perhaps you were right not to have agc it doesnt take much effort to turn down the gain when a powerful signal comes on the air de G3ZPA

39. MKARS20?

Yahoo group: mkars80
Date: 2007-08-21 10:08:36 UTC
From: Allan Copland
Topic: 39 Message: 39

Hi Folks,

I've just finished building my MKARS80 transceiver. I built it in three sessions making only one part placement mistake along the way (my fault entirely). This is the nicest kit of many I've ever worked on. The PCB is superb and the solder-mask with it's component placement markings plus the superb manual make construction really simple. After checking that the current draw and regulator voltages aere OK, I fitted the PIC and DFM.

The receiver worked perfectly first time after adjusting the operating frequency range as per the instructions. The audio quality is superb and sensitivity is excellent with the receiver pulling in plenty of stations with a meter lead as an 'antenna'!

Because it was late and I was tired, I headed for bed and left transmitter testing for another day... perhaps today!

I've built quite a few kits in my time but this one was superb. In particular, the manual is a model of clarity and my one mistake was down to doing too many hours in a single stretch.

Winding the toroids was easy with plenty of wire supplied for the job, unlike some kits that only provide 'just enough'. A hot iron is needed to tin the leads of the toroids (self-fluxing wire) and after constructing them and dressing the leads correctly, I spot-glued them in place with very small dots of 5 minute epoxy.

Having a pic based DFM, supply voltmeter and Huff&Puff really puts this simple transceiver in a different class from many other kits.

Improvements? I can only think of one..... a 20M version!

73 Al.

Thanks for the compliments Al, remember to let it warm up a bit before making any QSO's or you could face the embaresment of it jumping off tune as the Huff and Puff comes out of range.

One improvement I wil make when I have enough time is to change the software so when the Huff and Puff comes to the end of its range the radio just drifts NOT jumps off tune and perhaps flash the display to indicate loss of lock.

Steve G6ALU

Topic: 39 Message: 41

Hi Steve,

I am indeed on the MKARS80 group.

I was a bit taken aback that the radio worked correctly from a standing start. No remediation of any sort needed. I just tweaked it onto the correct frequency range and it worked. I agree that allowing a warm-up period is sensible. I'm used to VFO's anyway, but not ones with huff&puff. I particularly like the audio quality. It reminds me of my much loved FT200 and is probably down to having a relatively wide filter. I managed to copy plenty of stations at excellent strength on 80M last night with only a short bit of wire poked in the aerial socket.

Now all we need is a matching 20M variant (for £20 more?).

I previously built a couple of Tim Walford's kit radios for 80M, the Midney(RX) and Kingsdon(tx) and they simply can't compare with the MKARS80, either in terms of performance or features. They are also over twice the cost.

Adding a PIC to the MKARS80 to measure the frequency, stabilize the VFO and monitor the supply volts makes a lot of sense from where I'm at.

As an SSB trail radio, this would be difficult to beat, and especially at the price. I have an FT817ND but it's bulky, heavy, guzzles power and still only delivers 5W.

I do think there would be a sizeable market for a 20M variant of this radio at greater cost and perhaps with a change of IF frequency to keep the VFO frequency sensibly low. 16Mhz xtals are also cheap in bulk:-) OK, you'd have a heterodyne 'marker' near/on 14Mhz but the remainder of the band should be clear with a 2.0-2.3Mhz VFO.

Just a thought.

Allan Copland.

Alan,
A senior moment on my part there (my P.S.)!

I'm not planning on doing a companion 20M kit as most of my energies are going to be spent on a low cost ALL band transceiver... I have used the MKARS80 portable now several times and it is indeed good fun. Quite amusing with pile ups, just wait till the pile up disappears and say "QRP", the station often comes straight back in preference to the big noises!

Subject: RE: [mkars80] MKARS20?

Hi Steve,

I am indeed on the MKARS80 group.

I was a bit taken aback that the radio worked correctly from a standing start. No remediation of any sort needed. I just tweaked it onto the correct frequency range and it worked. I agree that allowing a warm-up period is sensible. I'm used to VFO's anyway, but not ones with huff&puff. I particularly like the audio quality. It reminds me of my much loved FT200 and is probably down to having a relatively wide filter. I managed to copy plenty of stations at excellent strength on 80M last night with only a short bit of wire poked in the aerial socket.

Now all we need is a matching 20M variant (for £20 more?).

I previously built a couple of Tim Walford's kit radios for 80M, the Midney(RX) and Kingsdon(tx) and they simply can't compare with the MKARS80, either in terms of performance or features. They are also over twice the cost.

Adding a PIC to the MKARS80 to measure the frequency, stabilize the VFO and monitor the supply volts makes a lot of sense from where I'm at.

As an SSB trail radio, this would be difficult to beat, and especially at the price. I have an FT817ND but it's bulky, heavy, guzzles power and still only delivers 5W.

I do think there would be a sizeable market for a 20M variant of this radio at greater cost and perhaps with a change of IF frequency to keep the VFO frequency sensibly low. 16Mhz xtals are also cheap in bulk:-) OK, you'd have a heterodyne 'marker' near/on 14Mhz but the remainder of the band should be clear with a 2.0-2.3Mhz VFO.

Just a thought.

Allan Copland.

Subject: Re: [mkars80] MKARS20?

Thanks for the compliments Al, remember to let it warm up a bit before making any QSO's or you could face the embaresment of it jumping off tune as the Huff and Puff comes out of range.

One improvement I wil make when I have enough time is to change the software so when the Huff and Puff comes to the end of its range the radio just drifts NOT jumps off tune and perhaps flash the display to indicate loss of lock.

Steve G6ALU

P.S. Are you on the MKARS80 Yahoo group?

43. MKARS80 More

Yahoo group: mkars80
Date: 2007-08-21 18:59:40 UTC
From: Allan Copland
Topic: 43 Message: 43

Hi,

Tonight I fitted the IRF510 and tested the TX strip. It works beautifully. My radio is still essentially an untidy pile of spaghetti on the bench but it works a treat. I need to get it boxed up and properly operational.

Re Steve's comments on planning a multiband radio, that's something I'd very much welcome were it to be as well presented as the MKARS80. The excellent manual made the building of this kit a real pleasure.

I've had a load of fun building the MKARS80 radio and the end result was certainly well worth the small effort involved. A very well presented kit indeed.

Hi all. Finished building yesterday and did final tune-up. Few minutes later had my first contact. In the next 3 hours I had 10 more. My QTH is in Sydney (VK2) and I worked VK2, VK3, VK4, VK5 and VK7 on an inverted V at 10 metres. Distances were up to 1500 km. Rig is still just the finished board on the workbench.

An absolutely brilliant little rig. Salutations to all involved.

From: Steve Drury
Topic: 46 Message: 46

I have had many enquiries with regard kit availability... I had expected to have kits available by now but unfortunately there aren't any LCD displays in the country at an acceptable price, I have ordered parts from the manufacturer so will take about 6 - 8 weeks to arrive.

Sorry for the delay but there should then be plenty of kits to satisfy demand, I will announce here when they are ready.

Regards,
Steve G6ALU

From: Steve Drury
Topic: 47 Message: 47

I have heard from many people who have successfully completed and are now using the MKARS80 but I'm sure there are a few out there who have run in to some problem or another.

If you have a problem you are welcome to ask advice here or if you would rather not go public send me a personal email. If you have started a kit but are unable to finish it for any reason then I will probably be able to find someone to finish it for you.

I'm sure collectively we can get all radios up and running!

Hi Anil,

The PCB they use for the display is the same for those with and without LEDs, I'm afraid these displays don't have any LEDs inside so can't be backlit.

Greetings all.

Glad to hear that Grahams problem was so easily solved.

Name here is Garry and I just sent payment off to Steve for a Mkars 80 kit. So one (at least) is headed for British Columbia Canada. I have the MMR-40 (built and running) and now this one soon I hope. (I have other kit built radios but these 2 are the only ones that do SSB so far) Once this one is done I will likely go for the Bitx20 which is being kitted as of last month.

It might be a tad distant to expect to make a contact from here to Europe and the B.I.'s on this band but you never know.

I expect it will take a good month or more to get here what with the festive season happening and bogging down the mail so hope to be working on it early in the New Year.

73 All I'm sure I'll be in touch.

Garry/Ve7ajj/Va7nv

Topic: 55 Message: 61

Hi Garry,
Perhaps a bit of explanation is required with regard Grahams display problem, it may help others avoid the same trap.

There are now many different manufacturers of LCD driver chips which are "compatible" with the original Hitachi type, the displays I use come from Powertip. Although the display PCBs are identical the manufacturer may use whatever controller IC he can source at the "right price", the last digits of the part number give the manufacturer.

I prototyped the MKARS80 with a device I had in my component draw for several years, this part functioned OK with the first released code (V1.0). When it came to supplying kits I found some old stock displays at the right price, these however had a different controller chip on board and weren't compatible with the firmware due to bug in the initialisation. Unfortunately this bug didn't cause problems with all displays so the first Beta test parts worked OK!

Luckily all the early kits were sold to MKARS club members so were easy to update - Grahams radio was missed as his radio wasn't available the evening I re-programmed all the controllers.

For those with an interest in PIC code it is easy to modify the program to show your own call at start-up, the code is on the MKARS website. I would recommend experimenting with a spare PIC16F818 though just in case!

Subject: [mkars80] Re: Display problem

Greetings all.

Glad to hear that Grahams problem was so easily solved.

Name here is Garry and I just sent payment off to Steve for a Mkars 80
kit. So one (at least) is headed for British Columbia Canada. I have
the MMR-40 (built and running) and now this one soon I hope. (I have
other kit built radios but these 2 are the only ones that do SSB so
far) Once this one is done I will likely go for the Bitx20 which is
being kitted as of last month.

It might be a tad distant to expect to make a contact from here to
Europe and the B.I.'s on this band but you never know.

I expect it will take a good month or more to get here what with the festive season happening and bogging down the mail so hope to be working on it early in the New Year.

73 All I'm sure I'll be in touch.

Garry/Ve7ajj/Va7nv

From: Steve Drury
Topic: 62 Message: 62

I'm sorry to say that there has been a kitting error with the latest batch of MKARS80s, it appears that the component supplier has mixed BC327 and BC547B transistors, BC327 transistors are not used in the kit! I have checked several kits and have found the issue in all, in addition I have found some kits also have MPSH10 transistors missing.

All of these components should be in Bag 4, to resolve the issue I will send a "repair" pack containing 16 x BC547 and 3 x MPSH10 transistors to all I have sent kits to so far.

Unfortunately there will be a delay of a few days in sending further kits out until all Bag 4s have been checked, I do not cash cheques until kits are sent.

My appologies for the inconvenience.

Regards,
Steve G6ALU

To Steve and all:

This may have been covered before, but I expect to be
assembling a mkars80 kit within the next month or so.
Is there any information I should read, or equipment I
should collect, in order to make the assembly process
go more smoothly? I know there are thousands of years'
of reading online about soldering and kit-building,
but specific suggestions by those who have
built/designed/worked with this kit and others like it
would be most helpful.

Thank you very much for your referrals and assistance.

Don't think there's anything you need that's not in the manual. Read it in it's entirety before playing with
the components.

Morning Steve,

Adding to Nigels comments:
The manual is quite comprehensive but doesn't really cover soldering technique so you may wish to brush up on that, as for special equipment you can assemble and test the radio with nothing more than a soldering iron, low cost ($10) multimeter, side cutters, long nose pliers and a screw driver. You will need solder which isn't included in the kit, for home construction I would recomend standard 60/40 multicore 22 orv 24 SWG (not sure what AWG that is).

Hope this helps.

Regards,
Steve G6ALU

I got my kit in the mail today. All I can say is that I was expecting to see it in the new year what with the festive season upon us and usually screwing up the mail big time. Nice work Steve, great prompt shipping. The only thing is I may not get to it for a few weeks sadly as I have a couple of other unfinished projects I am working on and time seems to be the thing most scarce around here.

I should have retired years earlier and I might have if I could possibly have known how busy I would get. HI HI

Been thinking about it.
You have 3 filters to re-tune and the LC in the local osc to play with.
If you end up with the LO on the "wrong" side of the signal, you will have to pull the BFO crystal down a
couple of KHz to get the correct sideband.
You may have to play with the software to get the frequency display correct or get the stabiliser to lock.

72. Ve7ajj Build

Yahoo group: mkars80
Date: 2007-12-13 22:24:07 UTC
From: Garry
Topic: 72 Message: 72

Hi All.

Just completed the installation of all the parts in kit bag #2. All seems to be going well. Found it tedious at first trying to find the location of each part on the silk screen but as I become more familiar with the layout and labeling scheme it has gradually become easier and easier to find the correct location (may also be due to the fact that some of the holes are now filled leaving fewer to look through).

A well documented project I would say. The kit creators are to be commended. Very reminiscent of the old Heathkit style of building.

I have built a number of kits recently and some have had minimal documentation which is not necessarily bad just perhaps more geared for the experienced builder. If all goes as it has through to the end then this kit would definitely be classified as a great project for the first time builder.

Time for a break right now before I tackle the 3rd bag. My back gets stiffened up hunched over the circuit board. One thing I like is the component layout. Most every kit today uses hairpin style positioning of the resistors and it was nice to have them lay down on the board. That could really help if any troubleshooting is needed.

Hi Chris,

Glad you got it going - does the transistor still read short C-E when out of circuit? I know one of our club members had a problem where a slither of solder passed through the bottom side of the hole and managed to short across the tracks on the top of the PCB, problem is it wasn't evident until voltage measurements were made. If you require a replacement transistor just ask.

I can confirm that as Q5 is working in class "A" it will get very warm (read quite hot!) in use, this transistor is working within its maximum ratings.

Let us know how you get on,
Steve G6ALU

Chris,

I have also used a Technika microphone and found it good quality - several of us use a microphone from the Pound Shop which also work well!

Remember when transmiting just speak loud enough so the red LED flickers off - if it stays off you are speaking too loud or close to the microphone.

Have fun,
Steve G6ALU

86. Clicking and popping a problem ?

Yahoo group: mkars80
Date: 2007-12-29 16:56:15 UTC
From: Uli
Topic: 86 Message: 86

Hello,
I am a new member in the group and building a BITX20A from
qrpkits.com, because I have no antenna for 80m.
I think both transceivers have the same origin: the bidirectional SSB
transceiver for the 20m amateur radio band, designed and built by
Ashhar Farhan, 2004.
I and some other builders have problems with the BITX20A and there is
the possibility that you have solved this problems in your design.

1.)
An awkward loud clicking and popping in the headphones, if you
push/pull the PTT.

2.)
When switching from RX and TX, we get a brief (200 to 400msec)
transmission of RF (full power!)

So please let me know, wheather you have the same problems.

Many thanks

73 and HNY
Uli

Topic: 86 Message: 87

Hi Uli,

You will see that the power and RF switching arangement is different in our adaptation - notice I leave the audio amp powered all the time and mute it with a transisto, this reduces the switching "pop" to a very low level. I haven't noticed a burst of uncontrolled RF at switch-over, I guess this could be caused by microphone feed back which I think I suffered from with the first prototype but has now been eliminated.

Regards,
Steve G6ALU

qrpkits.com, because I have no antenna for 80m.
I think both transceivers have the same origin: the bidirectional SSB
transceiver for the 20m amateur radio band, designed and built by
Ashhar Farhan, 2004.
I and some other builders have problems with the BITX20A and there is
the possibility that you have solved this problems in your design.

1.)
An awkward loud clicking and popping in the headphones, if you
push/pull the PTT.

2.)
When switching from RX and TX, we get a brief (200 to 400msec)
transmission of RF (full power!)

So please let me know, wheather you have the same problems.

Many thanks

73 and HNY
Uli

Hi Steve
many thanks for the quick reply.
I look for the differences in the 2 designs and take the best.
The modulation monitor is a nice feature - I will adopt this to my BITX20A

Regards
Uli

in our adaptation - notice I leave the audio amp powered all the time
and mute it with a transisto, this reduces the switching "pop" to a
very low level. I haven't noticed a burst of uncontrolled RF at
switch-over, I guess this could be caused by microphone feed back
which I think I suffered from with the first prototype but has now
been eliminated.

From: christian gondard
Topic: 89 Message: 89

I have spent some hours these 4 last days (when other family activities permit !) to build the MKARS80 kit

All went smoothly except my mistake on Q9 : I soldered a BC547 instead of a MPSH10 .. the poor BC547 lost one leg during the desoldering process .. As my local electronic shop is closed these days, I decided to continue the kitting, and choose not to install Q21 (amplifier on TX after the 10 MHz filter); so I will have all the RX chain, and the beginning of the TX chain.

I apply the 12V supply this afternoon at 18 o'clock, and all was fine : no smoke and a pleasant hum in the loudspeaker; after some adjustements on the VFO caps I was able to get a good coverage of the 80m band; after connecting my 2x20 m doublet on the BNC, a lot of stations were heard : so the little MKARS80 is working on RX !!; he can hear a 0.5 µV signal given by my RF generator;

On TX I can see the red LED and the relay clicking, and I was able to adjust the bias current of the IRF510 with R2; tomorrow I will try to detect the 10 MHZ SSB signal after the ladder filter

So a very pleasant kitting session, and results are at the level of my expectations !

Thanks a lot Steve for this very interesting kit, and congratulations for the very well done manual

I hope to make a qso these next days with another MKARS80

best seasons greetings to all on the list : I hope that 2008 will give you, first good health and success, and for ham radio, a lot of pleasures in kitting new devices, and using them !!

Nearly there then Chris, many transistors could be substituted for the BC547 - any high gain general purpose device; BC546, BC548, BC106 - 109 etc or even many of the 2N series if you observe the different pin-out.

If you need a replacement transistor let me know and I will drop one in the post.

How does one get the front panel template to print out in the proper size. It always seems to come out about 80% of what is needed?
Anyone got a bitmap file of this instead of a Pdf file? I know how to change the size of a bitmap or .jpg with the software I have but no experience with these PDF's

Gary,

When you print the front panel template, make sure the page scaling is set
to 'NONE and it will

Print the true size. Good Luck,

Hmm. Well it increased the size but still not to 100%. It prints at about 90% now. I'll have to scan it and save it as a .jpg or bitmap so I can adjust the size.

No problem. I'll get it.

If anyone has a generic front panel in TIF format then let me have it
so it can put it on the web... the PDF file should print OK if scaling
is set to none, also try setting the paper size to A4 in case Acrobat
is forcing a re-scale for different size paper.

Hello to all

My MKARS80 is now completed and fully working !!
It was really a pleasure to build it
Absolutely no trouble during the assembly process, except the poor
BC547 who loosed a leg during a desoldering operation !
I have already some qso with it this evening with french and german
stations
Output power is near 6 watts on a tune; RX sensitivity is about 0.5 uV
for 10db S/N, which is sufficient on 80m

Tnx to Steve G6ALU fot this very good kit

Best regards

72/73 de

Hello,

I am very interested in the MKARS80 unit! Are kits still available, and if so, what would be the cost? It is on my list of units to acquire in the near future.

Shipping would be to Seguin, TX 78155 USA

Thank you, Louis Upton

Hello,

You recently enquired about the purchase of an MKARS80 kit, these have now been assembled.

The price of kit and undrilled box is 45 GBP, postage is 4 GBP and if paying by Paypal I pass on their commission of 2 GBP making a total of 51 GBP. My Paypal account is g6alu@... , if you wish to pay by bank transfer please contact me for my bank details.

You can also pay by cheque (drawn on a UK bank) made payable to:

Mr S A Drury
25 Crosslands,
Stantonbury,
Milton Keynes,
Bucks.
MK14 6AY
England

If you are not already a member perhaps you would like to join the Yahoo group I have set up for support of the MKARS80, it can be found at - http://uk.groups.yahoo.com/group/mkars80/ .

No MKARS80 is NOT sold assembled, this is my poor use of the English language! What I meant to say is "components have been purchased and bagged up ready for despatch"!

All that wanted kits should now have been informed that they are ready, there are a few kits left over for any others wanting one.

Anil,

I've not proven it but my first suggestion would be to firstly disable the VFO (I'm sure you can work out how!) and remove C65 and inject the signal at this point.

111. Slow Mo drive

Yahoo group: mkars80
Date: 2008-01-22 13:48:23 UTC
From: gpratley
Topic: 111 Message: 111

Hi All,

Eventhough I only got the kit yesterday, and I've not even plugged the iron in yet I got a quote from mainline for the recommended drive.

They quote £3.67 plus £3.75 postage. (yes the postage is more than the item)

This got me thinking, about a group buy.

Anyone interested?

Cheers

Graham G0OBJ

Hello,
Interesting idea Graham, and obviously worthwhile......how would you get the item to the individual
who joined the group purchase ?. That assumes they would be scattered around the Country !
I know the postage cost per individual would be less than the charge made by the seller (Mainline)
but could still prove expensive.
If the idea goes ahead...........add me to the list.

Topic: 111 Message: 117

I guess my first post was just to see what the interest was like.
I'm not sure how many kits have gone out this month, or how much
benefit is to be gained by fitting a drive.

But the way I see the maths is that 1 unit costs £7.42. If I buy 10
they work out at £4.04 each. (almost half the price).

As you say there is then the cost of sending the drives out to each
of the Ham's. This would be added at cost to each person rather than
a blanket rate. I can't guess what this would be because of the
stupid way the post office now calculate the cost. But I would I
guess around a quid.

All this effort to save £2.50?

Greetings:

I just got my kit today, so amongst all the other things I have to do over the next few days (like reading for a couple of university courses), I will be cleaning up my work space and start working on the board starting tomorrow. (How many hours has it taken others to assemble the board?)

To get to my point, has anybody tried to use these el-cheapo computer boom mike/headsets? If so, I would like to know if you have been successful or not.

I am also anxious to get my NUE-PSK box and try it out with this little rig.

Jim,

In our local group most of us use el cheapo microphones, I have several; headset purchased from a radio rally for £1.50, several pound shop PC microphones and several very low cost desk microphones.

The radio has plenty of audio gain so most electrect mics will work.

127. VE3XJ Progess and Possible Mods

Yahoo group: mkars80
Date: 2008-02-26 13:02:05 UTC
From: ve3xj
Topic: 127 Message: 127

Greetings:

Not that this is all that earth shattering, but after finally getting down to the nitty-gritty of warming up the soldering iron last Thursday, I am up to the point of where I have soldered in D3, the power protection diode (darn good idea - it would have been my first mod if not included on the board).

I have been thinking of a couple of mods, both involving digital operation.

One is to build in a computer sound card interface for the computer generated modes, such as PSK31. This mod would lend itself to some experimentation with the digital voice modes. An example of this mod can be found in the photo section (as I recall) in the BITX20 group.

The second is a bit of a throw-back, NO NOT CW but direct FSK for rtty. I recall an article in the old 73 Magazine where someone modified a Heathkit 101 for FSK by adding a relay and a capacitor to the VFO circuit and then adjusting the capacitor in order to generate the 170 Hz shift. I think the author then used the rig in the CW mode in order to work RTTY and used the RX RIT to adjust the reciever for the ~2100 Hz tones to his demodulator. I was thinking of doing something similar with a varicap and some sort of electronic switching, perhaps a garden variety diode. At first, I dismissed the varicap idea and was considering going with an adjustable capacitor, because I thought that the varicap might drift after having been turned on. But I have been giving some second thoughts, and I think that freq drift would be minimal as the H&P stabilizer would take care of any freq drift. The other advantage with using the varicap would be that I could adjust it for the required tones for mod and demod.

As far as generating the transmit signal, I thought I would use an idea that Heathkit used in their SB301 transmitter for generating a CW signal by unbalancing the diode ring (using a relay to short circuit one of the diodes), thus unbalancing the ring thence allowing the carrier through.

Any thoughts on this approach or have others looked into this? No point in re-inventing the wheel...

Thanks & 73 to all,

Jim, VE3XJ

Forwarded to list from private enail....

Hi Steve

Last week 23rd, I put the almost ready MKARS80 on at the Finningley Amateur Radio Society and tried out the receiver on the G5RV. I am sure I heard your club.

This Saturday 1st March, I put the set on with all its bits attached and heard GB2IWM on 3.7511 calling CQ. Calling back with the club callsign G0GHK I got Max at the Imperial War Museum Duxford. He gave me 5&9+ and the output wasn't even getting warm. I did not find any problems lining it up.

During one over the frequency of the MKARS 80 jumped to about3.77 and he thought it was QRM. I only noticed it towards the end of the over and rapidly retuned. The huff & puff ?

Overall I am immensely impressed by its performance and would only think it could get any better if I could inject a 600-700hz tone to give me 'CW' capability. I could use a manual transmit switch or, if the relay was fast enough, use full break-in – any ideas about an oscillator (555 with sinewave shaper?) and where to inject and at how many micro/millivolts?

The mic/earphone combination is a £3.99 headset from Netto. I used the 3 core for the mic & PTT and the original mic cable paralleled across the earphone to give a 16 ohm impedance. I took the volume control out of the lead and substituted a little push to make switch installed in a miniature plastic hotel shampoo bottle about 5cms long.
I look forward to the more comprehensive multiband design I believe you are doing.

I am supposed to be on the Yahoo group for the MKARS80 but it doesn't seem to upload so you are getting this.

Feel free to put it on the web using my callsign G3WDL.

Thanks again

Topic: 128 Message: 129

Stuart,

I'm glad it works well for you, with regard to the sudden loss of lock from the Hufff and Puff; this is due to the VFO drifting to the edge of the Huff and Puff lock range at which point it will jump back to the centre tuning point. The amount of correction is shown by the bar graph, when it gets to one end its time to hand the QSO back and make an adjustment!

I built a CW interface and had John M0TIF (MKARS club chairman) try it out, he found it difficult to use due to VFO drift. It seems that CW has a higher duty cycle than SSB which exaggerates the drift phenomena.

I still have the prototype CW generator here if you want to give it a try?

Please be careful when using headphones, this radio doesn't have AGC and sometimes you can be surprised when a local station responds to a CQ call!

Regards,
Steve G6ALU

Thanks Steve

Can you send me the details of your CW generator. I'm always willing to try something new.

I was a Marconi Radio Officer, Merchant Navy for five years 60s-70s and the stuff we worked with had crystal controlled transmitters but the receivers were a bit variable and needed a hand on the tuning dial some days - I hardly ever used the superb filters because adjusting the tuning became boring trying to track a 100hz bandwidth.

As for the headphones, they were always worn just in front of the ears so that the pressure wave hit the skin instead of the ear canal and we had to wear them for quite a long time when at the desk. This is a habit I've never grown out of but I appreciate the warning.

I hadn't realised there was bar graph.

I will check the user group again and thanks again

Hiya Stuart,

Would be very interested to hear how you get on with your trials using CW with the MKARS80. I personally found the drift issue that is acceptable on SSB became far more pronounced on CW making it very difficult to use.

Cheers

John (M0TIF)

Hi John

It may be a while yet - lots of stuff to do - I am a Royal Lifesaving Society Adviser, have a couple of hobby jobs - RLSS South Yorkshire Branch Secretary and an open water Lifeguard Club Secretary. I only work part-time at a proper job but busy busy.
Any suggestions about stabilising the oscillator? (I like easy short cuts when someone else can do the thinking.)
Where is the drift coming from? Can we manually retune so that the huff n puff can keep within its control limits?
What length of over are we talking about? Can we just send short messages instead of a 'ragchew'?
At what point does the thing stop drifting?
Is it a positive towards HF or negative towards LF drift?

All these questions and more - can you add any?

Stuart

Stuart,

The drifting... this is caused by heating of the polyvaricon, unavoidable with this design as it is mounted directly to the PCB; I have tried spacing it from the board but found it makes little difference.

What can you do? Keep an eye on the little bar graph and slowly adjust the fine tune control to compensate, if you have a slow motion drive you will find it easier to adjust. As for general CW operation I will leave that for John to answer, I'm not qualified!

hi i now have my radio working on 15m. rx is ok signals seam a little
low so may need a pre amp. although the band is closed most of the time
the tx signal sounds ok on my old icom radio. but my tx output seams
to be in the Mw range i need to increse tx gain at Q9 or use a pre amp
afther the band pass filter any help feel free to say my other projects
for other bands with the mkars80 are on hold as i have just got a k2
with a,atu , ssb ,nb ,160m,units to build my 4th one i sold the others

Hi David,

The extendable antenna shown in the photo didn't prove to be very efficient, so I changed to a W3EDP wire. The W3EDP wire has given me HF /P contacts on all HF bands (except 160m) all over the world using various rigs and powers up to 100W.

Regards, Charlie/M0AIJ

Contact Steve Drury direct at hamlab3@...! The kits are still
being produced in batches, ordered and received mine back in January I
think it was! Very well made and packaged! Although, putting mine
together has been slow going! Too many other projects and commitments.

There were 2 unbuilt kits posted for sale last week, read message 140:
http://uk.groups.yahoo.com/group/mkars80/message/140

Good Luck! Cannot wait to get mine together and on the air! Will
have to wait for a rain day though!

I got the message OK but for any contact its best to use g6alu@... .

I produce kits in small batches, this is less tiresome than trying to get 100 sets of components together in one go!

My XYL bags up 5 sets at a time and I check all components from one set to make sure all is correct - I often mark the packing slip in pencil when I have coounted the components - so yes there is quality control for anyone wondering.....

Actually the PIC was easy, the inductors might need a little
researching. The ones listed have a higher Q and current ability than
the ones I am finding. Anyone know of any reason I couldn't just wind
some cores for those also? And for some reason 1/4 watt 1% metal film
resistors seam to be the least expensive, again ?

The resistors in my kit are 1/8 watt - not 1/4 watt! One would have a tough time fitting 1/4 watt in some places on this PCB.

The inductor listed appears to be discontinued! Oh, the joys of kit building! No cross over found either.

Davenpam <davenpam@...> wrote: Actually the PIC was easy, the inductors might need a little researching. The ones listed have a higher Q and current ability than

Yes the inductors listed are obsolete... I baught a job lot! There isn't anything special here though as they are all in low signal level positions, for the next builds they will probably be purchased from Rapid - www.rapidonline.co.uk . All resistors are 1/8 Watt to keep the radio neat and small, the ones I use are 60 pence per 100 except for the two close tolerance ones used as a divider on the input to the AD convertor for battery voltage measurement.

153. Audio Amp

Yahoo group: mkars80
Date: 2008-04-26 13:31:48 UTC
From: dagmine
Topic: 153 Message: 153

Hello everyone. I have been going through the MKARS80 Schematic block by block figuring out what each one does and how for my own education. The audio amplifier IC1 which is a LM386N-1 has an 1 uF electrolitic capacitor from pin 1 to pin 8 . Does anyone know how this value was selected? The Data sheet shows a 10 uF . I was just wondering.

David,

Putting a capacitor between pins 1 and 8 increases the gain from 20 to 200, by lowering the capacitance from the data sheet value of 10uF to 1uF the low frequency response is tailored to 300Hz or so from the data sheet 20-30Hz.

Subject: [mkars80] Audio Amp

Hello everyone. I have been going through the MKARS80 Schematic block
by block figuring out what each one does and how for my own education.
The audio amplifier IC1 which is a LM386N-1 has an 1 uF electrolitic
capacitor from pin 1 to pin 8 . Does anyone know how this value was
selected? The Data sheet shows a 10 uF . I was just wondering.

Steve, thanks for the info. Were can I learn about how the directional control circuits on both sides of the crystal filter work. They are really confusing me on how they operate.

David,

This link is where it all started.....

http://www.phonestack.com/farhan/bitx.html

It is Farhan's home page, he was the designer of the BITX20.

I think I get it now. They are not so much "switches" as transistor amps in to and out of the crystals. One on the input and one on the output for receive. One on the input and one one the output for transmit going the opposite way through the crystals. Farhan said they could not get a double balanced mixer to work for them but I believe that is what the MKARS 80 has. Must be that at the lower frequencies there are less problems.

I think the section you refer to is Asshar talking about input / ouput matching of a double ballanced mixer.

Topic: 153 Message: 159

Below is the part of the text I am refering to. It was the 2003 version, I just looked and the 2004 version uses a double balanced mixer the same place the MKARS 80 does and a two diode mixer for the BFO , again same as the MKARS 80

I/t should be noted here that we first tried a double balanced diode ring mixer at the front-end. It has a number of spurious responses that literally made it impossible to use the receiver. We tried to properly terminate the diode ring mixer by inserting attenuators between the mixer and the Ladder filter?s pre-amp. It didn?t cure the problem. When we changed to the FET mixer, the noise figure improved, the receiver?s dynamic range, while unmeasured, was never found lacking in the last one month of extensive usage at VU2PEP./

Dave,

I've not noted any spurious responses but remember the original was designed for 20M and the MKARS80 was designed for 80M. Unwanted responses are also related to IF frequency used.

Again thanks for the info. I am not saying there is anything wrong with the design. Quite the opposite, I like it so much I am trying to fully understand it so I can see what else I can do with it. Maybe change the IF to 9Mhz and do a 80 / 20 Meter Dual Band . An 80 / 40 is really what I want but that seams to be a little harder to do.

Thanks again

I wasn't being defensive David just matter of fact! What ever you plan
work out the interfering frequencies and unwanted mixing products
before you melt solder!

From: Trailriding_Texas
Topic: 153 Message: 163

I like your thought of an 80/40 dual band! We use those for EmComm Ops and it would be a great little unit to have! Have had my MKARS80 since just after the first of the year, and just barely started populating the board! Work and Ranch has been keeping me busy! I am new to all this, so the theories and practice are coming slowly, but I am learning!

Thanks all!

Louis

Davenpam <davenpam@...> wrote: Again thanks for the info. I am not saying there is anything wrong with
the design. Quite the opposite, I like it so much I am trying to fully
understand it so I can see what else I can do with it. Maybe change the
IF to 9Mhz and do a 80 / 20 Meter Dual Band . An 80 / 40 is really what
I want but that seams to be a little harder to do.

Thanks again

164. I like your thought of an 80/40 dual band! We use those for EmComm Ops

Yahoo group: mkars80
Date: 2008-04-28 21:17:28 UTC
From: Davenpam
Topic: 153 Message: 164

So lets start designing. I have seen an article on one project that was 80/40 but they used a 1.7 Mhz IF. not sure if thats the way to go or to have dual IFs at a higher frequency or dual VFOs. almost thinking dual IF, as in dual crystal filters. I should really finish my MKARS 80 first. It would be all done if I would stop taking it apart and changing things. Just added a backlit display, looks real nice with the light on. Tried to do varactor tuning but it was very unstable. Not sure if it was my varactor or the 10 turn potentiometer or both. I may try again one tuning knob would make it fit a lot better in my case.

From: carless7@tiscali.co.uk
Topic: 153 Message: 165

I made it as steve advised, and fitted it in the case provided, it works great, maybe the addition of a slow motion drive may improve it, i also included an internal speaker, the next mod maybe an internal battery pack, but apart from that i think its a great little rig.

Subj: [mkars80] I like your thought of an 80/40 dual band! We use those for EmComm Ops

So lets start designing. I have seen an article on one project that was 80/40 but they used a 1.7 Mhz IF. not sure if thats the way to go or to have dual IFs at a higher frequency or dual VFOs. almost thinking dual IF, as in dual crystal filters. I should really finish my MKARS 80 first. It would be all done if I would stop taking it apart and changing things. Just added a backlit display, looks real nice with the light on. Tried to do varactor tuning but it was very unstable. Not sure if it was my varactor or the 10 turn potentiometer or both. I may try again one tuning knob would make it fit a lot better in my case.

From: Trailriding_Texas
Topic: 153 Message: 166

I would love too, but I cannot even find the time right now to finish my original MKARS80, much less add a second band to it! Maybe come winter it would be a good project to tackle!

Davenpam <davenpam@...> wrote: So lets start designing. I have seen an article on one project that was
80/40 but they used a 1.7 Mhz IF. not sure if thats the way to go or to
have dual IFs at a higher frequency or dual VFOs. almost thinking dual
IF, as in dual crystal filters. I should really finish my MKARS 80
first. It would be all done if I would stop taking it apart and changing
things. Just added a backlit display, looks real nice with the light on.
Tried to do varactor tuning but it was very unstable. Not sure if it was
my varactor or the 10 turn potentiometer or both. I may try again one
tuning knob would make it fit a lot better in my case.

From: Chris Roselaar
Topic: 167 Message: 167

Hi All,
After having assembled my MKARS80 a week or two ago the RX seamed very deaf; hardly any audio on the connected external speaker (originating from an old CB-rig). At first I suspected soldering-errors around the trifilar wound transformers. I took the them all out, carefully re-soldered the ends of the wires and put them back in again - no change however:(
Today I plugged my PC's headset into the MKARS80 audio jack. To my surprise: bright and sufficiently loud audio?! Took me another couple of minutes to attach an electret microphone and a PTT switch.
And guess what? The first QSO's on 3.630 have already been made.
Reports mention very clear and easy-to-copy audio.
I like it- this is fun!
73's Christiaan PA3FUN

Christiaan,

I'm wondering if your speaker is faulty or if you have a problem around the LM386, believe me the radio has plenty of volume on large signals!

Check the voltage on pin 6 of the LM386 IC with the 8 Ohm speaker connected, it should be 10V or so.

Best of luck,
Steve

Steve,

You're a genius. As I just found out, the conus of the speaker was
stuck.
I just connected another speaker and it works UFB.
Never thought a mechanical issue was the cause of the problem....

Tonight lots of other Dutch stations on 3630 showed interest in this
fine radio.
I would not be surprised if more people from around here would contact
you to see if You've got a kit for them as well ;)

Hi All,

I am awaiting my kit from G6ALU (Steve) but I have been looking thru the constuction manual and it talks about pack 1,2 et al. Should I then construct the radio using the packs as the reference.

i.e. Mount pack 1 first then onto 2 etc.

Regards Dave

G1XAZ GQRP 11142

ps. I have low power black boxes this a new venture for me I have also ordered the Kendricks BitX20 and for that Cumbrian designs Digital Display (Still waiting for the Kendricks kit)

PPS. Also having my eyes tested next week..... Perhaps it should be my Brain. (Chuckle mode on)

Yes, the manual is set-up as such, to do one packet at a time! I am about half way through the construction of mine! Not sure the implications of doing out of order, but I am sure the designers had a reason for packaging as such!

I am a rookie at this, and have enjoyed it so far!

Hi Louis,

In the UK I shropshire RAYNET events organisor... noting the end of you email.

To be honest this is only my secons build yourself project my first was many years ago when I started into radio so about 1973.

That was a direct conversion reciever it took me longer to find out where I had screwed up than build the flippin thing.

Nice to know someone else is out there thats just starting

Dave,
Read the manual and all should become clear, if it doesn't I need to re-write it!

In the manual I instruct you what bag to take the component from and unless you are an experienced builder I wouldn't advise building out of order. You will see that components are generally fitted in height order, this is important as trying to fit capacitors after the coils are fitted is tricky.

The way the components are bagged might seem a bit strange, as for instance I have put zener diodes in 3 consecutive bags. This is to reduce the likely hood of the wrong diode being fitted - they are very easy to confuse with 1N4148s.

Any way I hope you enjoy the build.

If you use a temperature controlled iron hotter is better than cooler, I can't give you an exact temperature as it really depends on the bit size and to some extent your preference. When soldering (tinning) the ends of enamelled copper wire have the iron hot so the enamel burns off easily.

If the solder blobs and doesn't flow quickly the iron is too cold.

Hi Steve,

I know how to solder but before now I have screwed up I am thinking of buying a weller temperater controlled iron.

Like I said I hav'nt been here before. OK I am not qoing to be too much of a prat but some idea of what I am looking for is the Q (No 4)

I taught computer studies for some years but never had to use a blasted soldering iron.

Allow me to do a temperature test on our works Weller iron tomorrow and I will let you know my preference. The most important thing is to make sure the components are in the correct holes! Get some de-solder wick if you are ordering (2mm width is my preference), this will greatly assist in removing wrongly fitted components or solder splashes but MUST be used with a hot iron to be effective.

If you do wrongly fit any components it is probably best to cut their legs off and pull them out individually, I will then replace the component(s) free of charge.

A little investigation showed that with a professional Weller iron a tip temperature of about 375°C was good, this allowed the solder to flow well and also burned the enamel from the ECW relatively easily.

There is no need to go and buy an expensive temperature controlled iron though - I have added a picture to this group's photo section showing the set-up I used to build the first prototype kit, nothing fancy only cheap tools used.

Hi Steve,

I know how to solder but before now I have screwed up I am thinking of buying a weller temperater controlled iron.

Like I said I hav'nt been here before. OK I am not qoing to be too much of a prat but some idea of what I am looking for is the Q (No 4)

I taught computer studies for some years but never had to use a blasted soldering iron.

Dave

Hi Louis,

If you read the latter emails steve does say go in packet order as some components being smaller
should be put on the board earlier.

73 Dave

PS. Had email off Steve my kit sb here in the morning....

Yes, the manual is set-up as such, to do one packet at a time! I am about half way through the construction of mine! Not sure the implications of doing out of order, but I am sure the designers had a reason for packaging as such!

I am a rookie at this, and have enjoyed it so far!

Louis

Dave <g1xaz@...> wrote: Hi All,

I am awaiting my kit from G6ALU (Steve) but I have been looking thru
the constuction manual and it talks about pack 1,2 et al. Should I
then construct the radio using the packs as the reference.

i.e. Mount pack 1 first then onto 2 etc.

It's probably worth adding that for the inexperienced the old style solder (with lead) is much easier to use, and does a better job, than the new politically correct lead free stuff.

Also avoid breathing any solder fumes and especially the fumes from wire enamel.

Hi Dave in a word no. (Unless someone out there has researched all the different types and found a good one)

Lead solder is still readily available for repair work and some industries are exempt from using the lead free stuff on safety and reliability grounds which says a lot.

Get a reel with cored water soluble flux so the flux is easy to remove after soldering.

A small diameter solder is easier to control/use than thick stuff.

Lead free solder melts at a higher temp so it's easier to damage components during soldering. Also the finished joint is visibly different and it's difficult to see a dry joint.

Ray

Thanks Ray,

Are there any of the newer types that should be considered ?

Hi Folks,
Christiaan PA3FUN inspired me to order a MKARS80-tranceiver.
Within a week after receiving the kit from G6ALU, i managed to put the rig on the air on 3630. It was a great succes ! Good audio and sigs.
My compliments for the excellent description and manual.
The printed circuit board realy looks very professional !
I enjoyed building the rig very much and could not wait till the circuitboard was boxed to put the little one on the air.
I think this little tranceiver will inspire me to extend it with several practical options.
If done so, i will send a message to this bulletin board.

Hi All,

Dave is ready (G1XAZ) I have the main pack open so starting there.

Q. Do any of you suffer from hand movement and no feeling in your hands
the reason I ask is I suffer from both but if other members (builders) understand how to hold the components in place I would be very gratefull to know what methods have been used.

I have asked Steve (G6ALU) about winding the torriods for me but I would prefer to do that myself if possible, but bless him he will help.

I am not asking Steve Yet!!!!.

Holding components on the PCB and soldering them in place is my no 1 wish.

Regards All.

I place 10 or so components at a time and then solder, sometimes more, depending on how crowded the leads get!

Just place the leads in the proper holes, with the component snug against the board, and then bend the leads out about 45 degrees. There is a picture of this on page 3 of the manual. When ready, flip to the solder side (I use a helper stand sold by Radio Shack) and solder away. When done, snip the leads and continue on to the next set!

Hi I sometimes have problems with shaking hands and reduced movement due
to a very bad RTA , I try and work when they are not so bad or do
bigger types of things. I also rest my hand on the bench or object to
reduce the shakes . The SMD are very difficult to work with and I
practice a lot for a long time before using them, The real bad one to
solder is the AD9835 DDS chip it has a very small pitch. I flood
soldered it and used solder wick to remove the excess. These devices
seem to be very much more resistant to heating issues , but the tracks
are so fine they sometimes lift off if too much heat is used.
I have wound a few toroids now by sewing the wire with a large eyed
needle borrowed from the wife. It works well for me but it gets
difficult with the very small ones. Anyway I wish you luck.

Hi Barry,

Thanks for the reply. I do have a secret weapon MY WIFE Jen M3XAZ she is taking over my M3 callsign I got it when G1's were allowed on the HF bands only used it a couple of times then
discovered we had HF (Uhhhh Hummmm).

Anyway she is ok soldering but I will try doing the torriods myself but if I get stuck I am not
going to push them at
Jen.

Hi I usually just lurk in this group, but might I suggest using solder paste for SMD components. I use an embossing heat gun, the components and solder snaps onto the traces once the paste turns to solder.

You can pick up a syringe of solder paste for $5 here
http://www.zianet.com/erg/ShopSolderPaste.html

He has a nice tutorial with video for using the paste here
http://www.zianet.com/erg/SMT_Soldering.html

I personally don't use the hotplate, just the embossing gun, and it works wonders. I picked up my embossing gun from Micheal's craft store for $15.

Hope this helps,
Chris, KI4ZLX

From: David Lacey
Topic: 187 Message: 195

Dave, from another Dave,
Tending to be a little lazy at times, I put in a number of (like) components in at a time. Now I know that statement is going to cause some criticism, especially when you are trying to follow rigorously a set of build instructions !
The point I am going to answer is.....holding in components whilst soldering
I use a soft piece of foam rubber, place it over the components after insertion, carefully turn over the (package) and solder in ONE lead at a time for each component inserted. Doing one lead at a time allows you to check carefully that the item is "fully home" on the pcb before soldering in the final connection. If the component has moved during this operation, it is easy enough to "correct" the problem before moving on.
Hope the information is of help, thing is to experiment, and to find the easiest method that suits you and the materials that you may have to hand.
Just a word of caution....foam rubber burns ! be careful with the iron.
Have fun, there is always a way round any problem.
Regards
Dave G4JBE

I use Blu tac gum to hold components against the board and also to hold the thin capacitors upright so I don't bend them whilst handling the board.
When I have soldered the toroids. I use hot glue to hold them down.
My mkars80 is excellent.

Not sure what relavence this has to the MKARS80 as it doesn't use ANY surface mount components, for soldering I recomend thin solder (22 - 24SWG) and a hot iron.

I use Blu tac gum to hold components against the board and also to hold the thin capacitors upright so I don't bend them whilst handling the board.
When I have soldered the toroids. I use hot glue to hold them down.
My mkars80 is excellent.

Subject: Re: [mkars80] OK All, Where do I start !!!

Dave, from another Dave,
Tending to be a little lazy at times, I put in a number of (like) components in at a time.
Now I know that statement is going to cause some criticism, especially when you are
trying to follow rigorously a set of build instructions !
The point I am going to answer is.....holding in components whilst soldering
I use a soft piece of foam rubber, place it over the components after insertion,
carefully turn over the (package) and solder in ONE lead at a time for each
component inserted. Doing one lead at a time allows you to check carefully
that the item is "fully home" on the pcb before soldering in the final connection.
If the component has moved during this operation, it is easy enough to "correct" the
problem before moving on.
Hope the information is of help, thing is to experiment, and to find the easiest
method that suits you and the materials that you may have to hand.
Just a word of caution....foam rubber burns ! be careful with the iron.
Have fun, there is always a way round any problem.
Regards
Dave G4JBE

Subject: [mkars80] OK All, Where do I start !!!

Hi All,

Dave is ready (G1XAZ) I have the main pack open so starting there.

Q. Do any of you suffer from hand movement and no feeling in your hands
the reason I ask is I suffer from both but if other members (builders) understand how
to hold the components in place I would be very gratefull to know what methods have been
used.

I have asked Steve (G6ALU) about winding the torriods for me but I would prefer to do
that myself if possible, but bless him he will help.

I am not asking Steve Yet!!!!.

Holding components on the PCB and soldering them in place is my no 1 wish.

Regards All.

Dave G1XAZ

Hi All,

Sorry for this but I have been a Linux guy for many years and just purchased a new
HP laptop came with Vista on it.. uhhh hummmmmm. Prefer my Linux but all I was trying to do was change my dispalyed name in outlook express that was easy but windows mail it has all changed.

Anyway sorted now sorry for the extra emails to sort it out.

Further comment I have been happy with linux for years and purchasing this new HP laptop I am forced
to use msnot again.

Sorry for grinding the post again but why when you buy a new machine you do not have the choice of
what op sys you wish on it.

Regards All Dave.

Sorry I have wasted bandwidth with a few of you that are not broadband but untill I could see what was
displayed to the group... Sorry I Kept going.

Regards ALL Dave G1XAZ

Good heavens Dave. Why are you stuck with Vista? There are many different Linux Distros out there and most of them have a downloadable "live CD" that you can use to test the Distro with to ensure that all functions work as desired. Once you find one that does (I suspect most of them will be capable of finding and installing all of the necessary hardware) simply reformat the hard drive and install your Linux version. Or if you wish, rather than reformatting the HD, partition it, (yes you can do that without messing up the Windows install) and make your machine a dual boot.

If I can do it I imagine anyone can HI.

I'd like to say "Catch you on the air with the Mkars80" but I suspect it won't happen between us without a tad more power than the wee beastie currently puts out.

It will take linux time to catch up with device drivers for a new laptop.
I bought one a month ago and couldn't find a distro that would play with properly with the video hardware or even see the network interfaces so
had to go back to the preinstalled Vista.

207. move frequency up a bit?

Yahoo group: mkars80
Date: 2008-06-08 20:30:28 UTC
From: Mike
Topic: 207 Message: 207

Hey guys,
I built a Mkars80 kit and it works great but I want to move the
frequency up to the US portion 3.600-4.00mhz. I was wondering if
removing turns from the oscillator will move it up or adding turns? It
now covers from about 3.500-3.700MHZ

thanks

Mike

From: Steve Drury
Topic: 207 Message: 208

Hi Mike,
Its normally possible to get more range than required for the UK allocation, how low in frequency will the VFO go if you set the top end for 3.8MHz?

Look at the second column on page 12 of the instructions, this indicates which trimmer on the back of the polyvaricon will adjust the range. If sufficient range isn't available you may have to increase the value of C47 (68pF) a little, I suggest adding 10pF NP0 type capacitor to start.

Winding turns OFF the VFO coil will increase its frequency so decreasing the tuned frequency, winding turns ON will increase the tuned frequency but also decrease the tuning range; changing the number of turns may not help.

Let us know how you get on,
Steve G6ALU

From: Stephen Wandling
Topic: 207 Message: 209

Hi Steve,

I'm glad Mike asked this question. I had taken the specification of "whole 80M band by VFO" to be 3.5-4.0Mhz. I now realize that the reference was to the UK allocation. Since the UK allocation is 300Khz, am I correct to assume that the tuning can be shifted to 3.7-4.0Mhz, without any problems?

Reading your post below it seems that more range can be obtained. Can the shift and the extended range both be obtained at the same time? Can you say approximately how much the range could be extended. For example, if the top end is set at 4.0Mhz, is 3.6Mhz possible for the lower end? If not then what is the approximate range that can be obtained?

Further, there is some mention on the MKARS site about a DDS VFO. Has this option been made available?

Thanks

Stephen,
I need to check my MKARS80 to answer your question accurately but I'm sure others have extended the range with little or no component change. The greater the frequency coverage the lower the stability....

We decided not to incorporate a DDS or CW option - it seemed appropriate to leave the radio as simple as we could and save these additional features for a later radio design.

211. Help! My mkars80 is deaf!

Yahoo group: mkars80
Date: 2008-06-12 16:05:11 UTC
From: Vincenzo Calandra
Topic: 211 Message: 211

Hi all,

first apologize me for my bad English.

I received my MKARS80 on the end of November 2007 but only in last two weekend of may i find the time to build it.

The package (and the enclosure) was crushed and next i discovered two toroid was broken.

After the preliminary test i connect an antenna (my 40mt dipole) and a loudspeaker.

No signal! Only a soft wispering come out from the loudspeaker. I advanced the r.f. gain but no change.

With a finger i make a test on the af part. Some "huummm" coming from loudspeaker. Good. The a.f. work!

With the my signal generator (as a signal tracer) and scope i understand that the problem was on xtal filter. During this test i discovered a broken termination on T4 so i rewind it.

I replaced all the xtal and now i heard some thing but if i put the level of signal generator at -50 dBm the signal was inaudible!

I verified all the voltage (only in receiver mode at this time i don't test the trasmission) and only the following voltage are different:

Q7 emitter 0 (ok) base measured 0,05 (normal 0,39) collector 2,3 (ok)
Q19 emitter measured 3,6 (normal 3,0) base mes. 2,9 (normal 3,7) collector 7,5 (ok)

Someone can help me with an advice?

Where i can get a schematic whit higher resolution? I printed it with a laser printer using the best resolution allowed (1200dpi) and with a good magnifying glass it's difficult to read the value.

Many tanks!!!

Hi Enzo,

Sorry to hear your package was crushed, something very nasty must have happened to crush an aluminium case! Had you told me a lot sooner I could have claimed compensation from the post office but unfortunately after all this time they wouldn't accept it. If you require some replacement toroids I can send you those, just let me know.

Both the transistor voltages are about normal, most of the problems I have found have been due to solder splashes but these normally show up with incorrect voltages on the transistors.

You may like to try and set up the transmitter and then see if it will transmit any power, remember that most stages work on transmit and receive.

If all else fails please return it to me and I will get it going for you, my address is on the letter you received with the kit.

I will be making a multi-part diagram as I have been asked by others to do this.

Regards,
Steve G6ALU

Hi Steve,

The front room table is clear, Telly put where I can watch it.

Yep Pecky is starting... Check you emails and if ANY SENSE a block on
my email address.

The comment earlier on about the torroids, could I please ask you to wind them for me
and what pennies do you require.

Regards Dave

AND PUT THAT BLOODY BLOCK ON MY EMAILS (chuckle mode on)

I have generated a hi resolution schematic - load into your favourite paint program and
print the area / resolution required.

See http://uk.groups.yahoo.com/group/mkars80/files/

218. Things to watch out for

Yahoo group: mkars80
Date: 2008-06-20 15:57:56 UTC
From: Steve Drury
Topic: 218 Message: 218

Black boxes in display
I have changed the manufacturer of the LCD display, the new one is 100% compatible with the MKARS80 and the previous display.

This new display has a wider bias adjustment range - when first turned on you may see black boxes where you expect to see characters; this isn't a fault, simply adjust R29 (adjacent to the micro) so the black boxes just disappear leaving the text with a good contrast.

Short circuits caused by washers on RF gain and fine tune fixings
Two constructors have had a problem where the large serrated washers fitted under the potentiometer fixing nuts can short to adjacent PCB tracks. When fitting the washers check that this doesn't happen. It is permissible to fit the controls WITHOUT these washers.

These are omissions from the manual which I will correct and re-issue.

From: Dave - G1XAZ
Topic: 218 Message: 220

Hi,

Is there a Net that those of you that have built these radios go onto and natter.

I presume most of you are around Milton Keynes but I am little further away in North Shropshire Nr Telford.

Dave G1XAZ

PS. I am quite aware these things can go world wide but 80 is a good natter band up here I natter to a guy on 17mtr and he is only 3 mile away. (Natter Band)

The problem with a net local to me is just that... 80M propogation doesn't really support local nets but a country wide (UK) net early evening may be possible.

Does someone want to suggest a day, time and frequency? Perhaps the QRP segment at 3690kHz but not sure what time of day would suit most.

Hi Enzo,

Your MKARS80 is sorted, your construction was good and it was a simple problem - some of the transformer wires hadn't had the insulation melted off when they are soldered. In my experience this is due to a soldering iron which was not hot enough.

I had a QSO with my friend Alan 2E0GLD to prove it worked OK (using his MKARS80), I also worked a couple of stations in the contest today!

The kit will be sent back to you this week when I have wrapped it up VERY carefully to make sure it doesn't get damaged.

Regards,
Steve G6ALU

Hello Steve & MKARS members,

Collected my kit from Sutton & Cheam Radio Society meeting today.

I am not into building electronic kits, etc, so this will be an interesting build for me.

Luckily I have the Sutton & Whitton clubs with members I can turn to.

Might be back here a few times with Questions.

Jerry,

Use any electret type microphone - we use PC type microphones from pound-land but any similar microphone will do. If using a dynamic microphone like a CB mic which is of the coil and magnet type you will have to remove the bias resistor R17.

Regards,
Steve G6ALU

235. It's going - almost!

Yahoo group: mkars80
Date: 2008-07-18 20:28:23 UTC
From: ve3xj
Topic: 235 Message: 235

Well, I finally got my kit going, at least on the recieve side. However, there are a couple of problems and I hope there might be some expertise out there...

1. Little audio. When the band is busy in the evenings, there is not much audio. I have the gain cranked right up, and I used two different earphones, and you sometimes really have to have the ambient noise down in order to listen to the rig. I checked the voltage on pin 6 on the LM3866 chip, and there is 12.6 volts... Is there anything else that I should be looking for? (When I checked the voltage, I accidently shorted the probe between pins 5 and 6. I did see a small puff of smoke, but I didn't see where it originated from. So to be safe, I got another 386 - it just so happens it is the one watt variety as that is all my local parts emporium had. I am going to solder in a socket as well - I have always been leary of directly soldering chips... call it a personal foible...)

2. This is probably related, but we could not discern any difference in tuning the bandpass filter while adjusting the capacitors. Mind you, we were trying to do it by ear with a signal from a signal generator and listening to the audio. I think a better way to do it would be use my MFJ269 as a generator with the MFJ adjustable attenuator (to provide a 50 ohm load) feeding the MKARS, and and with a scope on the other side of the filter, adjust for peak, with one cap for the high-end of the band, the next for mid-band and the third for wht lower end of the band? Does this make sense?

Thanks for any advice....

73

Jim, VE3XJ

Jim,

With a decent antenna and at night you should have some VERY loud signals.

The smoke probably came from R10, if it still reads around 4.7 Ohms then don't worry about it.

First thing to do is measure all the transistor voltages and confirm they are similar to those I give in the manual, if you are lucky this will show where the problem is.

The bandpass filter is only used on transmit and is wide, just adjust the capacitors as indicated in the manual and it will be tuned OK.

Is the circuit sensitive around the crystal filter output? Try it by touching the non ground side of D19 and D20, this should produce crackles, buzzes and posibly recption of broadcast stations - if there is no activity here look for problems from this point through to the audio amplifier.

If you have a signal generator (perhaps your MFJ269 with the attenuator) and 'scope connect the generator to the antenna socket and set it to mid band (3.7MHz ish), with the speaker / phones removed and sufficient output from the generator follow the signal through the circuit. It should be amplified by each transistor stage - remember though that to test past the first mixer you must be tuned to the signal.

If you set up the output transistor bias do you get any transmit power?

Let us know how you get on.

Subject: [mkars80] It's going - almost!

Well, I finally got my kit going, at least on the recieve side.
However, there are a couple of problems and I hope there might be some
expertise out there...

1. Little audio. When the band is busy in the evenings, there is not
much audio. I have the gain cranked right up, and I used two different
earphones, and you sometimes really have to have the ambient noise down
in order to listen to the rig. I checked the voltage on pin 6 on the
LM3866 chip, and there is 12.6 volts... Is there anything else that I
should be looking for? (When I checked the voltage, I accidently
shorted the probe between pins 5 and 6. I did see a small puff of
smoke, but I didn't see where it originated from. So to be safe, I got

another 386 - it just so happens it is the one watt variety as that is all my local parts emporium had. I am going to solder in a socket as well - I have always been leary of directly soldering chips... call it a personal foible...)

2. This is probably related, but we could not discern any difference in tuning the bandpass filter while adjusting the capacitors. Mind you, we were trying to do it by ear with a signal from a signal generator and listening to the audio. I think a better way to do it would be use my MFJ269 as a generator with the MFJ adjustable attenuator (to provide a 50 ohm load) feeding the MKARS, and and with a scope on the other side of the filter, adjust for peak, with one cap for the high-end of the band, the next for mid-band and the third for wht lower end of the band? Does this make sense?

Thanks for any advice....

Jim,

Stuart G3WDL reminds me that he had a similar problem (low audio) which was caused by an open circuit 4.7 Ohm resistor - please check this before going any further. If you require any replacement parts please let me know.

Regards,
Steve G6ALU

Topic: 235 Message: 239

GOT IT! I am listening to ONTARS (the Ontario Amateur Radio Service) running from 7 a.m. to 6 p.m. on 3755 khz, time now being 5:35 p.m. and I am hearing most, if not all the stations throughtout Ontario checking in before the net closes for the evening. Using a 4-inch speaker that I picked up from the local parts emporium for 12 loonies and it is doing well.

The problem turned out to be at Q19 - an MPSH10, the first (and only?) RF amp. We diagnosed the problem by injecting a 10 MHz sig at the input and output at Q15 and confirmed that amplifier was working. Then we injected a signal at the rig indicated signal (I think it was around 3750 or so, and noticed that there was no difference. Measuring the voltages on the base and emitter and both were around 3 volts - not in accordance with the voltage chart. Fortunately my friend Pat VE3EUR is an avid QRPer and had a bunch of these transistors so he gave me a couple. I just popped it in a few minutes ago and hooked it up to the antenna. Can't explain why the original transistor went to that big dipole in the sky, but I guess it really doesn't matter. By the way, the MFJ269 and the MFJ adjustable attenuator worked well, but the 269 is not that stable, but it is adequate.

So the next thing to do is start modifying a computer boom-mike headset along with the TX check out, then boxing it up. I hope to bring it to the next Ottawa Valley QRP group monthly. Might even check in one of the other nets later on tonight.

So thanks for the advice Steve! (Turns out the audio amp chip and R10 (4.7 ohms) are just fine, no need to replace. I was considering building a little circuit for the 1 watt chip to put into the speaker that I bought yesterday, but Pat showed me a neat little amp board that he got from kitsandparts, so I am going to looking that.)

73 all

Jim, VE3XJ

P.S. For those in the Eastern Ontario area - the OVQRP sponsors Chilicon on the last operating weekend (20/21 Sept 08) of the Rideau River Provinical Provincial Park near Kemptville, ON about 20 minutes from Ottawa. We set up our various stations and operate just for the heck of it, while camping out for the weekend. It is called Chilicon because for the last few years, I have provided the Friday night dinner - Chili! (I haven't had one complaint!). So if you are in the area, come on out!

Jim,
I'm glad its working now.

Did you check the transistor after you removed it? I think I mentioned in an earlier group message that I have found a sliver of solder across two pads of the same transistor before. I will make a note for the next person who has this problem.

It just shows though that the first fault finding method should be voltage measurements.

Best of luck.

Steve:

No, I didn't bother to check the original transistor - I didn't even think to do that. If I can find the original transistor, and if there is enough lead length, I will check it out with a diode tester and see if there is anything unusual and let you know.

On a completely different topic.... I have this really nice knob with a reduction drive, but it is just too big to fit on the case provided. However, I have a much bigger case (approx. 6.25"l X 3"h X 9.75d) in order to accommodate the drive but it would also mean dismounting the digital display, VR1, VR2, LED and VFO main tuning capacitor and remount them on the metal front panel. Is that going to be a problem? The only part that could be problematical could be the VFO cap, but I can use a short piece of RG-174 back to the board. Another issue would be heat sinking the final, but I have a heat sink that would probably work inside the case. Finally, the front and rear panel are metal, but the rest is plastic. If necessary, I have a roll of copper foil and I can use that to line the plastic case part, and jumpering it appropriately to the front and rear panels. So, if I could have your thoughts on this plan, I would appreciate it.

Hi All
All seems to be going to plan according to the instructions.
Just come to install the display and it is not clear which holes in
the display are supposed to line up with the socket beneath. There
does seem to be enough play to move the display one hole either way.
Just a senior moment but could somebody put me straight before I make
a cockup, it would be a shame at this point.

Jerry,

Its the left-hand most holes, if you are unsure have a look at the 2nd prototype picture in the groups photo section.

Sounds like another photo is required in the construction manual.

Hi Steve
Thanks for the quick solution, just as an update I got the set working
this afternoon and although there was plenty of loud hiss in the speaker
the odd station I got was quite feint.
I will be trying it again tonight when hopefully there will be a number
of strong signals around.
So here's hoping

Stations will be louder in the evening, remember that 80M radios benefit from decent size antenna - I use a full size G5RV, signals are VERY loud!

Hi Steve
Thanks for the quick solution, just as an update I got the set working
this afternoon and although there was plenty of loud hiss in the speaker
the odd station I got was quite feint.
I will be trying it again tonight when hopefully there will be a number
of strong signals around.
So here's hoping

Hi Steve
All finished and the receiver worked well last night.
I connected up the display following your instructions and that is working fine as well.
As far as the receiver is concerned I now only have one minor problem, I cannot adjust C38 far enough to read 3.45 Mhz.
I suspect it may be to do with the windings on L5 which should be 4.8uH, my coil is, as I checked it on a PEAK inductance meter before I fitted it although I am suspicious that it may have one or two more turns than 40.
Any ideas?
When my mike arrives I will have a go with the TX.
On talking about extra pictures in the build manual, you may want to add something to the second para under construction on page 3 the LED is also mounted on the other side of the PCB. Only a comment which might be useful to the less experienced builder.
From my own perspective this has been one of the nicest kits I have built and I have built a few.
So thanks for all your effort in developing it and also your continued enthusiasm in helping to resolve problems.

Jerry,

Remember that the IF is ABOVE the signal and oscillator frequency, this means if the oscillator is running low in frequency the tuned frequency will be high.

If you think there are more than 40 turns on the oscillator inductor (L5) and haven't glued the to the board yet I recommend you remove it and count the turns. I haven't found this problem before.....

With regard suggestions for the build manual and the next revision; perhaps we can start a new subject so I can find the changes easily when the time comes to do the new release.

251. Construction manual - notes for next revision

Yahoo group: mkars80
Date: 2008-07-25 17:10:09 UTC
From: Steve Drury
Topic: 251 Message: 251

I have generally had good comments with regard the current MKARS80 construction manual (version V1.1) but I am aware there are some omissions and the odd minor error.

If anyone has any suggestions with regard additions or changes please reply to this mail (on the group), I will use the list generated when making the next revision.

Things I'm aware of:
1.. Error - schematic diagram has the PTT and microphone contacts of CON1 transposed.

2.. Change - Set up instructions for R29 (the display bias setting), currently comes after oscillator and PA bias have been set, reposition to just after power is applied. The control should be adjusted for a correctly contrasted display at first switch on - if left fully clockwise, with some displays you may only see black boxes .

3.. Clarification - Mention that the LED fits on the underside of PCB and can be left off until fitting to case.
"Fit LED from track side and solder on component side", does this need clarification?

4.. Clarification - Mention (and photo?) that the display should be fitted using its left most connector holes.
What have I missed?

Steve G6ALU

252. Going backwards

Yahoo group: mkars80
Date: 2008-07-27 17:03:56 UTC
From: Jerry A Bligh
Topic: 244 Message: 252

Hi Steve

Good news and bad news I think I am going backwards
For those builders wanting to use it on the US 80 meter band up to 4Mhz
all they need to do is add a couple of turns to L5 and they have it
cracked, in my instance I corrected my problem by taking a couple off as
I obviously had to many.
Now the bad news, whilst aligning the oscillator to correct the above
problem, all of a sudden the normal high volume disappeared. I
subsequently found out that the output transistor had got a bit hot, I
think it may have bent over and shorted out to something.
That may pose a problem when I come to try to TX. I want to get it
reeiving properly first.
I have carried out the following.
Inserted an AF tone to pin three of chip 1, there is an output but not
ear splitting I would have expected more.
inserting the tone from one end of R28 gives an output but not from the
other side furthest from IC1
R28 resistor is OK
Checked the 4K7 resistor and tried another speaker as discussed on the forum
Checked all receive voltages on transistors and IC1 all seem to be close
Also injected a tone into Q6 nothing out of speaker
I also tried the set last night, plenty of signals and very clear just
very feint
Any ideas please as I am running out of them now I have been round the
possibilities so many times I can't see the wood for the trees.
Regards
Jerry

253. A couple of problem and fixes

Yahoo group: mkars80
Date: 2008-07-27 18:44:41 UTC
From: mb130853
Topic: 253 Message: 253

Hi all

I am sorry if this has been posted before but it may save some of you wasting some valuable time.

I have just finished building the transceiver and was doing initial tests. My VFO was displaying between 4.2Mhz and 4.5Mhz. I checked L5 on my peak LCR tested and found it to measure 4.9uH. I must have had too many turns on L5 and after removing some I got the correct range.
My fault☐

Here is the other problem I encountered which turned out to nothing wrong with this kit.

I was using a Maplin Temperature Control Solder Station (part no: N79AR the one they had on offer for £10 some time ago). As a soldering iron it works very well but it also generates noise across the whole of the 80 metre band. So if you are using one of these on the bench remember to turn it off before setting up this rig.

I have run out of time this weekend to complete the set up but should get the kit finished with in the next week.

Jerry,
You may notice the design error around Q6, R18 the bias resistor is too low causing the gain of Q6 to be low - don't change it they are all the same!

You should be able to hear a loud mains buzz if you touch pin 3 of the output IC. It may also be wise to check the mixer transformer wires have been soldered properly.

One way to test the mic and audio output stages is to short Q3 base to emitter whilst pressing the PTT (with a microphone connected), you should get massive feedback! You will get more output by injecting a signal the IC end of R28 rather than the transistor end.

If all else fails I will get it going for you... if you solve the audio problem I will send you a new IRF510, it sounds as though it did get too hot. Try to be quick when setting the PA bias up and keep an eye on the transistor temperature - you normally smell it getting hot! Overheating is the only way I've killed them!

Regards,
Steve G6ALU

255. Bag 2 problem

Yahoo group: mkars80
Date: 2008-07-28 21:14:23 UTC
From: Paul
Topic: 255 Message: 255

Hi group,

Was glad to finally finish Bag 1 (still a novice kit builder) and was keen to start bag 2 until I found a minor problem.

I have 3x 10pF ceramic capacitors and no 8pF ones in the bag.

I will continue with rest of bag as that seems OK, but what can I do to sort this minor problem out.

Happy with Kit so far and is a far cry from the Morse Oscillator I built to get my 2E, and boy have I learnt loads already.

Thanks in Advance

Hi Paul,

Sounds like you are using the wrong version of the instructions, if you purchased the kit recently then you should be using version V1.1.

Hi Steve,

That's typical of me. 2 manuals & I download the wrong one. Hope bag 1 was the same though.

Back to a double check of bag 1.

Don't panic!

You have found the differences... with the first version I managed to pick a hard to obtain choke which had to be changed as well as their associated capacitors.

I had to keep version V1.0 of the manual on the net for the slow builders!

259. Now another problem

Yahoo group: mkars80
Date: 2008-07-29 22:18:35 UTC
From: ve3xj
Topic: 259 Message: 259

Greetings:

I set the TX bias adjustment to 50 mA greater than when R2 was fully counter-clockwise. I also adjusted the carrier null to as low as possible using a spectrum analyser, but there was still a significant carrier. After plugging the PTT-Mike and headphone plugs, when I key up, the red LED is lit, and the output is a tone, no modulation is heard on another reciever. Any ideas out there what I should look at next? (I stand to be corrected, but could there be a problem with the diode rign mixer, D12,13,14, and 15?)

Topic: 259 Message: 260

Jim,

It sounds like the tone on the other receiver is just the carrier and perhaps the fault is in the Mic amp or modulator. If you short Q3 base to emitter whilst pushing the PTT do you get a loud oscillation from the MKARS80 speaker?

Shorting out Q3 B-E puts the audio amp mute transistor out of circuit allowing the amplified microphone signal to pass straifgt through to the audio amplifier.

Let me know the result.

It should be possible to null the carrier out nearly completely, have you adjusted R59 and C103 together? Note that they are interactive.

Topic: 261 Message: 261

Hi Steve

Completed the alignment last night and managed to keep the smoke in the components. The setup is very easy and once you get the test gear powers up only takes a few minutes.

I managed to receive a few German stations, a GW and MW in conversation and a Morse practice session.

I only had an 80 metre mobile whip with no ground plain, so I was very pleased with the performance.

Now to the part I find difficult, the cabinet.

I am planning to give listeners a fuller account of my progress my next Podcast scheduled for recording this Sunday. This can be found at www.icqpodcast.com.

Yahoo group: mkars80
Date: 2008-08-01 15:56:53 UTC
From: ve3xj
Topic: 259 Message: 262

Hi Steve:

OK I shorted the B-E leads of Q3. I could still hear background noise, but the oscillation was not what I would call loud and it varied in tone (due to body capacitance, I don't know.) I also checked the voltages on Q2 and Q4 and they were all within .3 volts according to the chart (probably due to meter error. I must admit that I really should invest in a good quality DVM. But then again, having just retired from the public service, "good enough for government work" is often indeed sufficient HI HI!)

I am wondering if I might be looking at T5 to see if that is the problem. I recall seeing a response from you to another chap and you told him his problem was that the enamel on one of his transformers had not burnt off enough, due to the use of an insufficiently heated iron. I have another soldering iron which I believe is in the 50 watt range and I could warm that up and heat the board connections...)

By the way, a somewhat interesting note on Q3. When I was parts stuffing a while back, I lost the transistor... somehow got brushed off the work space and I had no idea where it went as the carpeting in the shack is mottled and dark - impossible to find and retrieve short of getting a vacuum cleaner out...) Anyways, I found a replacement - an NTE123AP (an NTE123A is also indicated, but the device is in a can with a tab indicating the emitter lead). Now despite the warming from NTE that the lead pin-out were reversed, with respect to the key information, I guess I had a senior's moment and installed it wrong. Realizing that last night, and after re-orinting it properly, I had hopes that I had solved my problem. As I emailed my friend VE3EUR - NOPE!. When I hit the send button, I am going to give Pat another phone call and see if we can brainstorm some more...

I sure do hope to have this done by 14 August - it is the monthly get-together of the OVQRP (Ottawa Valley QRP group) to show it off... Maybe even get the varactor tuning circuit installed.

73

Jim, VE3XJ

P.S. Yes, I knew that R59 and C103 were interactive so I would tune one to minimum and then tune the other for minimum. I noticed that C103 was critical (that is to say, it did not take much rotation to notice the change) while with R59, initially there was an obvious change, but at the point of the lowest minimum, I could turn the pot control two or three times either way before there was any change...

I think I am going to stay away from the spec-A the next time I do this adjustment, it just make life too complicated for the benefits recieved - I'll just use one of my recievers in the shack...

Steve:

I should have done this before sending the last message... I measured the voltages on Q3... Nil on recieve, as excpected, but on transmit, the base lead shows 3 millivolts, a far cry from what is indicated in the chart. I am scratching my head because that is a new transistor....

Jim,
Sounds like a problem on Q3 if there is no volts on its base even in TX. Check the volts across R5 in TX, one side should be abot 12 the other 0.6 - 0.7. Check for a short circuit transistor or perhaps a solder splash.

See also my next message to Jerry re the output transistor.

Subject: [mkars80] Re: Now another problem

Steve:

I should have done this before sending the last message... I measured the voltages on Q3... Nil on recieve, as excpected, but on transmit, the base lead shows 3 millivolts, a far cry from what is indicated in the chart. I am scratching my head because that is a new transistor....

Jerry,
Received the radio for repair today and after a few minutes located your problem; Q3 (mute transistor) was being turned on by a small voltage on the TX12V rail which comes from the relay.

How could this happen? A clue to the answer is in your comment "all of a sudden the normal high volume disappeared. I
subsequently found out that the output transistor had got a bit hot".

You accidentally let the smoke out of the output transistor which subsequently went Drain / Gate leaky; there was 7V on the drain which worked its way through the bias circuit onto the TX12V rail! Snipping the sick transistor out of circuit cured the problem.

I will replace the transistor and give it a good check over and adjustment, as always there is no charge for parts but I would be grateful if you could refund my postage.

Regards,
Steve G6ALU

PS This is a nicely built radio, its a pity you had a problem.

Subject: [mkars80] Going backwards

Hi Steve

Good news and bad news I think I am going backwards
For those builders wanting to use it on the US 80 meter band up to 4Mhz
all they need to do is add a couple of turns to L5 and they have it
cracked, in my instance I corrected my problem by taking a couple off as
I obviously had to many.
Now the bad news, whilst aligning the oscillator to correct the above
problem, all of a sudden the normal high volume disappeared. I
subsequently found out that the output transistor had got a bit hot, I
think it may have bent over and shorted out to something.
That may pose a problem when I come to try to TX. I want to get it
reeiving properly first.
I have carried out the following.
Inserted an AF tone to pin three of chip 1, there is an output but not
ear splitting I would have expected more.
inserting the tone from one end of R28 gives an output but not from the
other side furthest from IC1

R28 resistor is OK
Checked the 4K7 resistor and tried another speaker as discussed on the forum
Checked all receive voltages on transistors and IC1 all seem to be close
Also injected a tone into Q6 nothing out of speaker
I also tried the set last night, plenty of signals and very clear just
very feint
Any ideas please as I am running out of them now I have been round the
possibilities so many times I can't see the wood for the trees.
Regards
Jerry

Hi Steve

Wow that was quick

WHATS IT LIKE TO BE A SUPER HERO

I suspect that you have seen it all before what with the number of builders.

Please let me know the postage so that I can reimburse you immediately.

Thanks again

Jerry

Subject: Re: [mkars80] Going backwards

Jerry,
Received the radio for repair today and after a few minutes located your problem; Q3 (mute transistor) was being turned on by a small voltage on the TX12V rail which comes from the relay.

How could this happen? A clue to the answer is in your comment "all of a sudden the normal high volume disappeared. I
subsequently found out that the output transistor had got a bit hot".

You accidentally let the smoke out of the output transistor which subsequently went Drain / Gate leaky; there was 7V on the drain which worked its way through the bias circuit onto the TX12V rail! Snipping the sick transistor out of circuit cured the problem.

I will replace the transistor and give it a good check over and adjustment, as always there is no charge for parts but I would be grateful if you could refund my postage.

Regards,
Steve G6ALU

PS This is a nicely built radio, its a pity you had a problem.

Subject: [mkars80] Going backwards

Hi Steve

Good news and bad news I think I am going backwards
For those builders wanting to use it on the US 80 meter band up to 4Mhz all they need to do is add a couple of turns to L5 and they have it cracked, in my instance I corrected my problem by taking a couple off as I obviously had to many.
Now the bad news, whilst aligning the oscillator to correct the above problem, all of a sudden the normal high volume disappeared. I subsequently found out that the output transistor had got a bit hot, I think it may have bent over and shorted out to something.
That may pose a problem when I come to try to TX. I want to get it reeiving properly first.
I have carried out the following.
Inserted an AF tone to pin three of chip 1, there is an output but not ear splitting I would have expected more.
inserting the tone from one end of R28 gives an output but not from the other side furthest from IC1
R28 resistor is OK
Checked the 4K7 resistor and tried another speaker as discussed on the forum
Checked all receive voltages on transistors and IC1 all seem to be close
Also injected a tone into Q6 nothing out of speaker
I also tried the set last night, plenty of signals and very clear just very feint
Any ideas please as I am running out of them now I have been round the possibilities so many times I can't see the wood for the trees.
Regards
Jerry

269. Re: Now another problem

Yahoo group: mkars80
Date: 2008-08-02 12:05:21 UTC
From: ve3xj
Topic: 259 Message: 269

Steve:

Well, I measured as you suggested and I got the voltages on R5 on transmit as expected. I then measured the base lead of Q3, and the voltage is now as expected. I am at a loss as to why it didn't read that when I made the first measurements (perhaps I was measuring the wrong transistor?) That being the case, I am going to try shorting the B-E leads with greater care, and see if I can hear the oscillation. Last time I did it, the audio stayed on, but now loud oscillation.

On the suggestion of my friend, I clippped R17, on the theory that my mike was not the type that needed a bias. That didn't work either..

Anyways, I am going to try to borrow an audio generator and scope it out, starting from the input to the mike amp and go from there...

Jim,

It's unlikely you damaged any transistor by shorting its legs together (excepting the output FET).

If it gets desperate I will repair it for you, I don't charge for components or my time but do request you pay return postage - unless it is my fault of course!

Regards,
Steve G6ALU

Hi Steve:

Well, I am not going to give up yet... I hope to get together with my friend (the thinking is that two heads are better than one) and he has an audio generator and a scope. The idea is to inject a tone into the mike jack and look at each stage on the scope and see where the problem is. So hopefully, by Friday, I will be able to give you an update...

272. My MKARS80 can hear!

Yahoo group: mkars80
Date: 2008-08-05 18:40:11 UTC
From: dl4aaj
Topic: 272 Message: 272

Hi All,

About 10 days ago I got my MKARS80 kit from Steve. What a fine kit, I'm very impressed, although I should have known because many others before me already told so. :-)
Meanwhile I've populated the board, made the initial tests and fitted the controller and display. Every alignment procedure shown in the construction manual went without problems, and my MKARS80 is receiving very well ☐ even with my poor excuse for an antenna aka test lead <1 meter.
Next will be the transmitter test.
As I already mentioned I am very impressed, both with the kit and the finished transceiver! (Almost ☐ it's still without enclosure). Not a single problem during the building process. This kit shows what can be done if somebody really cares. Thank you, Steve!

Heinz "Hannes" DL4AAJ

273. Re: Now another problem - AND FINALLY SOLVED!

Yahoo group: mkars80

Topic: 259 Message: 273

Hi Steve and Others...

Well, the problem has been found, and I made my first contact with the rig. Turned out that the mike of the computer headset that I was initally using wasn't working at all; so it was no wonder I had no output. As soon as I wired up a cheapee Radio Shack dynamic mike, I made a contact with a station north of Montreal, about 100 km as the crow flies from here, who was running a net. His only comment was that my audio sounded rather funny. With that report, I immediately suspected that the poor audio was related to the the poorly adjusted carrier suppression because we had measured the unmodulated carrier at 3 milliwatts. So with a nearby reciever without an antenna, I was able to adjust R59 and C103 such that there is no S-meter reading. Subsequently, there were a couple of other chaps on the band, and they said the rig sounded fine.

The next step is to build that little varactor tuning circuit...

Steve, thanks so much for your help and tips..

275. Progress - Bag One Complete

Yahoo group: mkars80
Date: 2008-08-11 22:27:22 UTC
From: hamfm1000
Topic: 275 Message: 275

Have taken the plunge, got me a kit and the latest post of the working rig is spurring me on.

Have completed bag one without any major problems, thanks to an illuminated desk magnifier. <g>

Will have a break from it now and tackle bag 2 over the coming weekend.

Slightly OT, anyone suggest the best band to have a dabble at QRP CW? Need to start off with a few simple QSOs around 8-10 wpm to get my ear and fist back in the game.

Hi Tony

Good news on the kit, enjoy the building. On the CW thing I don’t do CW
however
I would think that 30 metres(10MHz) would be a good place to start. There
are no contests
Run on this band so you should get help.

Hi Tony;
My kit is still in the box because I'm building a KX1 for a friend, promised to finish it before starting on this one.
As for the best CW band, try 40 meters if you have something that will go there. there is almost always someong hanging around either 7.030 or 7.040.
Cheers

Hello Tony,

Can I suggest you try any of the FISTS CW club frequencies probably the best ones being 3.558, 7.028, and 14.058, you can be sure any members will adjust to your speed and give full encouragement. I frequently monitor 3.558 if I hear you will of course get back to you.

Well done with the MKARS80.

Hello Ron,

Two suggestions home-brew and kit.

The home brew one I built was from SPRAT magazine issue 130, there is a picture on the photos area of this MKARS80 group. Its a design by G3EJS and I have used it with the MKARS80 with a G5RV and a long wire works very well. If you don't have access to this issue of SPRAT and interested let me know.

Secondly I build the Hendrix long wire / ATU kit. This is very small ATU with an LED that extinguishes when adjusted for lowest SWR. Very nice kit at a reasonable price. I will post some pictures on groups photo area.

Good luck

John (M0TIF)

Well done Tony,

I am onto bag 3 and besides minor problem of printing wrong manual
it's progressing well.

I feel I should mention my kit building experience thus far was a
morse oscillator for my 2E licence.

Tomorrow will be continuing with the 51 100nf capacitors(?).

Now looking for when I finish at building a Byonics APRS unit, but
seems childs play by comparison.

Message to Jerry 2U0BGE

Jerry, your postbox is full so my reply to your private mail is below.....

Jerry, I tested it on air so I don't think you have a problem.

Let the radio warm up for half hour or so and you should find it stabilises, it will only drift then if you transmit with long overs. When I do presentations on this radio I make a point of telling every one to make a note of the operating frequency in their log at the start of the QSO in case you forget what frequency you started on.

When in a QSO keep an eye on the Huff and Puff bar graph, if it gets to either end hand the QSO back to the other station and carefully re-tune.

Talk loud enough so the LED flickers off but doesn't stay off, this is the correct level.

I hope you enjoy using the radio..

Regards,
Steve G6ALU

Build is progessing well.
Now half-way through bag 4.
I'm sure that I counted 51 100nF caps. Might have got a spare one <g>
Will look for an empty position during final board checks.

Went looking for microphones in 'the pound shop' - they don't seem to
have any at the moment.

287. OK - Board completed and Smoke Tested

Yahoo group: mkars80
Date: 2008-08-19 22:30:06 UTC
From: hamfm1000
Topic: 287 Message: 287

Well after peering at completed board under the desk magnifier to check orientation of components and the solder side for any of the usual nasties it was time for the smoke test. I'm glad to say that there was no smoke or nasty noises from the speaker. Voltages at test points OK. So off went the power and then to fit the PIC and display. After switching on and adjusting there it was, frequency and voltage display.

Saturday then is boxing up time!

Tony,

Here is how I set the radio up WITHOUT any specialist equipment.
1.. First check the receiver functions correctly - it should be very lively in the evening! Then disconnect the antenna before continuing.
2.. Set the VFO range - turn the tuning control fully clockwise (minimum tuned frequency, adjust C38 (orange preset capacitor) for a displayed frequency of about 3.45MHz. Note that if turned too low the display will suddenly read > 5MHz.
3.. Set up the PA bias (R2) by following the instructions - if you have a spare stereo jack plug then short all its connections together and plug into the microphone socket. This will put the rig into TX without any microphone audio. First measure the current (a convenient place to measure is across the fuse holder with fuse removed) with R2 FULLY ant-clockwise, then slowly adjust R2 clockwise until the current reads 50mA more than the first measurement. Note that the current doesn't increase for a while then increases suddenly. Make sure the PA transistor doesn't get too hot to touch.
4.. Using a nearby radio receiver on CW or SSB (but NOT connected to the MKARS80) tune until you can hear the carrier signal adjust R59 and C103 to minimise this; note that they are both interactive.
5.. Remove the microphone plug and whilst listening to a good clear signal adjust C83 for good audio; if C83 hasn't been touched before turning it between 90° and 180° normally gives the best result. Note that when adjusted correctly every one will appear to be transmitting on the right frequency, don't panic though as this isn't a critical adjustment.
6.. Adjust C54, C68 and C79 to the position shown in the instructions - again this isn't a critical adjustment.
7.. If you have a dummy load (use a couple of 100 ohm resistors in parallel if not) do a test transmission, if the LED flickers off in normal speech all is good and its safe to make a CQ call.
Best of luck.

292. Varactor Tuning Mods

Yahoo group: mkars80
Date: 2008-08-23 17:26:12 UTC
From: ve3xj
Topic: 292 Message: 292

Greetings:

I have uploaded a schematic in the Files section, and three pictures in the Photos section relating to a modification that I have made to my MKARS80 transciever.

The modification consists of the removal of the main tuning capacitor and replacing it with an MVAM109 varicap, a 1 Megohm resistor and an NPO capacitor on the board, while off board, there is a 10k pot for main frequency control, a sub-band selector switch and a resistor matrix board.

The original circuit had only one off-board component, the 10k pot. However, the resultant frequency varitions were too great even while rotating the pot knob with the greatest of care, making it difficult to net in a station easily. As a result, I added a selector switch and a resistor matrix board, dividing the band into four sub-bands. In effect, the selector switch inserts the pot as required within a voltage divider chain so that instead of tuning the whole 75/80 meter band, only ~125 kHz is tuned. Thus, tuning to a station on the band is much easier with only touch-up as required by the existing fine tuning pot.

When you view the picture for the resistor matrix board, you will note that in two of the legs, there are two resistors, while the schematic shows a single 30kohm resistor. I could not find a 30kohm resistor at any of our local parts emporiums, so I just seriesed (?) a 10k and 20k ohm resistor in the leg.

Since my rotary switch has two unused positions, I plan to add two more legs. However, instead of using the main tuning pot, I will use a small PCB pot, set one for favourite net frequencies (3755 and 3775, for example). Call it a "poor man's" frequency memory.

This modification was prompted by my wish to put the board in a bigger case than what was provided by the kit. I plan to include a Ni-Cd battery pack with charger (taken from a cordless drill that was on sale), a sound card interface, SWR meter, mike pre-amp and 2.5 watt audio amp kit, and the means to generate a tone for adjusting a tuner.

At first I was considering removing the polycap from the board and mounting it on the front panel. However, I waas concerned that moving the polycap would introduce stray and varying capacitances and would make the rig unstable. After querying Steve if anyone else had modified the rig for varactor tuning, he was kind enough to send to me a schematic by Ron, PA0RCL which was used as a basis for this

modification. Therefore, I wish to thank Ron for sharing his design with me.

If you wish to try this mod yourself, please contact me if you have any questions.

Good morning Ray,
Kit costs and method of payment are:

Kit including an undrilled case (no knobs) 45 GBP
Postage UK 3 GBP
Postage Europe 4 GBP
Postage rest of the world 6 GBP

If you can pay in sterling then make a cheque out to:

Radio-Kits
25 Crosslands,
Stantonbury,
Milton Keynes,
Bucks.
MK14 6AY
England

Or you can pay by Paypal but you must pay the comission of 2 GBP -
make your payment to val@... .

So for you Ray it will be 53 GBP paid to our Paypal account.

Regards,
Steve G6ALU

Mike,

The easiest way to disable the Huff and Puff is to pull the micro - you obviously won't get a display but you will be able to determine if its stable enough for you. I think you will put the micro back quite quickly!

Its always best to let the radio warm up for at least half an hour and keep an eye on the bar graph (lower right of display), if the bar gets to either end its time to hand the QSO back and centre the tuning. You might find it more pleasant to operate by using a slow motion drive on the polyvaricon - I don't but its personal preference.

Yes although with either method it would be desirable to bias D5 away from ground - perhaps connect a 1k resistor from junction R40 / C50 to 5V.

The more elegant way would be to change the micro code, if you have a programmer I can send you a modified file.

No programmer here :(But what I am really wondering is why is this vfo drift so much? I have a Hendricks kit BITX20 on 20 meters which is fairly stable and the Mkars kit was designed around that? Maybe its because of the 3 Poly caps in the VFO?

Thanks

300. Re: [mkars80] Re: How can I turn off the Huff and Puff?

Yahoo group: mkars80
Date: 2008-09-25 07:31:33 UTC
From: g6alu@tiscali.co.uk
Topic: 295 Message: 300

First some facts...

The MKARS80 is based on the BITX20
The Hendricks kit is based on the BITX20
The MKARS80 pre-dates the BITX20A by some months so isn't influenced
by it.

I think the difference between the Hendricks BITX20 and the MKARS80
(stability wise) is that the MKARS80 has all the components mounted on
one PCB including the polyvaricon, I did this to make the performance
less determined by the constructors ability also produces a neater and
smaller product.

Has your BITX20 been cased? I've found stability is much improved by
running the MKARS80 out of its case but this isn't practical as it was
designed to be portable!

There are two 1nF polycarbonate caps in the VFO, these were chosed as
a lower cost alternative to 1nF NP0 types which couldn't be obtained at
sensible prices... is the third Poly cap the Polyvaricon? Everything is
made to a price, I had to ballance cost against performance; I think
this ballance is correct, after all how many radios can you build for
less than a tank of petrol?

Most users find the stability to be quite acceptable after the warm up
period, I wonder if your radio has a problem?

From: mb130853
Topic: 301 Message: 301

Hi Steve and the group

Just a quick not to say that my MKARS80 is complete and working fine.
I have worked stations in the south of England and down into Wales
with very good results.

I will be taking the radio to Ireland this weekend and will be
operating from just outside Waterford as EI/M1MRB/P. I look forward to
contacts from the group. I will be giving my review and updates via
icqpodcasr.

Once again Steve, thanks for the club talk and for producing a great
transceiver.

Topic: 295 Message: 303

Hi Mike,

I used my MKARS80 on holiday last week and had several arranged QSOs, if I was back a bit late and had to use the radio straight away it would be a bit prone to drift, but if I was back in time that I could leave the radio on for half an hour or so things were much better. I know the radio is built to a cost but it seems to work very well if you leave it to warm up and keep an eye on the Huff & Puff bar on the display.
Hope this helps

Thanks for the info guys but there must be some issue with my rig...I
left it on for 24 hrs plus and it still drifted

Thanks
Mike

Just a thought Mike,
Have you fitted the internal speaker option, or did you take the pots and varicon off board to use a custom case? If you did, lead length or magnetic interference from a speaker might be the problem. Mine is built as per kit and the guys at the radio club are pleasantly surprised at its stability.

I repaired a radio the other day which was competently soldered but the type of multi-core solder used left a lot of residue behind, the radio appeared to drift a lot but I didn't test it properly until I had made it presentable by cleaning the flux of the board - when tested it worked with similar stability as others I have built / repaired.

If your board has a lot of flux residue on the solder side I wonder if stability would be improved by cleaning it off, although in the instructions I advise against cleaning as you don't want any fluid getting on the trimmer capacitors or into the Polyvaricon.

The chemical I use is a professional solvent called Fluxclene, I tried using isopropyl alcohol but this left a nasty residue.

307. Software modification to show Out Of Band warning

Yahoo group: mkars80
Date: 2008-10-10 13:41:27 UTC
From: Matthew Robinson
Topic: 307 Message: 307

Hi all,

I have just uploaded a new version of the software for the PIC processor that displays an Out Of Band warning when the radio is tuned outside of the Australian 80m band. In Australia we have a "hole" in our 80m band between 3.7MHz and 3.776MHz and I have modified the software to warn when the radio is tuned inside this "hole." The software also displays the OOB warning if the radio is tuned below 3.5MHz and above 3.8MHz.

I have uploaded the new files (the assembler and the HEX files) to the "Out of Band Software Mod" directory in the Files section. To build the software you'll also need the include files from the original source code package.

It shouldn't be too difficult to modify this code for different "holes" in other areas. Feel free to contact me if you are interested in this modification.

Matt - VK6MSR

Matt,
That sounds great.
Would you be able to post a version that doesn't have holes as well?
It would be really useful.

If you want to program your own PICs you will need a programmer, for those with a serial posrt see Winpic (www.qsl.net/dl4yhf), the help file includes details of programmers - I use the simplest!

I use a serial programmer that is available as a kit from Jaycar (think Maplin but in Australia). I like it because it has ZIF sockets for the processor chips. It is designed to use the WinPIC software that Steve mentioned and I use it with a USB-Serial adapter as serial ports are becoming a dying breed.

The kit was originally published in the May 2008 issue of Silicon Chip magazine here in Australia. Information on the Jaycar kit is available at http://www.jaycar.com.au/productView.asp?ID=KC5467

HTH,

Matt

From: Matthew Robinson
Topic: 307 Message: 312

I am happy to make a UK version of my hack if someone wants to confirm the details of the band and the SSB windows within the band.

I am inclined to keep the current OOB display for Out of Band and display something else for "Out of band plan". Does anyone have a suggestion for a 3 or 4 character message to show out of band plan, perhaps OOBP? Also would people like me to place the boundary at the actual boundary or 3kHz above the boundary to account for the bandwidth of LSB?

Matt,
It would be gratefully received!
Here's a link to the bandplan.
http://www.rsgb-spectrumforum.org.uk/bandplan.htm

The lowest LSB setting it says to use is 3,603KHz

Perhaps you could display the message on the supply voltage line on the display, which changes back to voltage when in band?

Not sure what the highest setting would be - assume it would account for the 3kHz offset and be 3,803kHz, so that the emission is still in the amateur band - anyone more expert care to comment on that, or should it be 3.8MHz dead to be on the safe side?

would "Out of 80m Bandplan" Fit the width of the display?

Topic: 307 Message: 314

Hi Tony,

The code handling the display of the second line is quite tightly integrated in to the Huff and Puff code. Given that I am still learning my way around the source code for the MKARS80 I've been sticking to only writing to the first line as that is all contained in the frequency display section of the code (which is where I'm doing the tests to see if we are OOB).

In the first instance I can make some modifications to show OOP or OOBP in the top line. If I have time to get more involved with the source code I might be able to use the second line in some instances.

I shall see what I can do. However, I'm about to go away for a couple of weeks so it might be the end of October till I get to it.

Matt,
OOB on first line is still fine with me.
I'm not in any particular hurry - have written the band limits near the readout on the rig (QRP approach there)
Haven't looked at the source code yet myself...
Been busy building a few more bits to go with the MKARS80.
Here are the links...
http://4sqrp.com/kits/td/td.htm
Antenna analyser on a budget.
Could be built from the schematic without the morse annunciated frequency.

http://www.pongrance.com/
Digital dial on a tighter budget, can be used as a frequency counter.

From: Steve, G4GXL
Topic: 316 Message: 316

The size and shape of the MKARS80 make it ideal for operating
'pedestrian mobile' (as it used to be called).
Unfortunately the efficiency of short verticals on 80m creates a challenge.

I'm thinking of a 6 foot centre loaded vertical on a backpack with a
trailing 30 foot wire counterpoise (I usually walk around the Norfolk
coast where there's plenty of space).
Anyone trying something similar - what results are you getting ?

Hi Tony,

I'll see what I can do in the next couple of days. Shouldn't take too much work to get a UK version done.

I've just finished building (still need to box it) an Antenna Analyser from VK5JST. From my first quick tests last night it seems rather nice :) Kits are available from the South Coast Amateur Radio Club, http://www.scarc.org.au/projects.html

I think we are quite spoilt in Australia for good kits (I certainly think they are better than the kits I remember being available in Maplin et al in the UK). Jaycar (http://www.jaycar.com.au) and Altronics (http://www.altronics.com.au) have a good range of kits. Altronics recently released a rather nice Digital LC meter which I built a few weeks ago, http://www.altronics.com.au/index.asp?area=item&id=K2533

Silicon Chip magazine here in Aus has some excellent projects and a lot of the Jaycar/Altronics kits were originally published in SC.

I was reading up on a GPS 10MHz frequency source today in a couple of back issues that looks rather nice. A little pricey (about AUD350 ~ GBP140) but you do require a Garmin GPS OEM module and external antenna. Still much cheaper than a commercial version though.

i used to use a 20 metre vertical on 80 metres. it was 17 foot tall and got good results amazingly but used counterpoise wire a few feet above ground. never tried one as short as 6 feet though - de G3ZPA

NNNN

To: mkars80@...: steve.g4gxl@...: Tue, 14 Oct 2008 10:11:47 +0100Subject: [mkars80] OT: Aerials for portable operation

The size and shape of the MKARS80 make it ideal for operating'pedestrian mobile' (as it used to be called).Unfortunately the efficiency of short verticals on 80m creates a challenge.I'm thinking of a 6 foot centre loaded vertical on a backpack with atrailing 30 foot wire counterpoise (I usually walk around the Norfolkcoast where there's plenty of space).Anyone trying something similar - what results are you getting ?73Steve, G4GXL--QRP ARCI Webmaster - www.qrparci.orgMyAPRS Map - www.g4gxl.com/aprsMember: QRP ARCI, G-QRP, TAPR, ARRL, RSGB, BATChttp://www.ServaLink.net - monitoring your website 24/7Email or phone notification of faults, hacks and outages within 60seconds. I will have a stand at the Leicester amateur radio show
http://www.lars.org.uk/ next Friday and Saturday so if any one is
visiting you are welcome to come and say hello.

I will have spares with me so if you have some thing missing or broken
anything come and get it replaced!

322. Is this kit suitable for PSK31

Yahoo group: mkars80
Date: 2008-10-27 15:30:24 UTC
From: g8xlh
Topic: 322 Message: 322

Hi All,

Is this kit stable enough to run PSK31 ?

Using standard PC/Soundcard programs like MIXW and Digipan ?

Regards

Alan

From: Steve Drury
Topic: 322 Message: 323

Good evening Alan,

Although I used the first prototype with Digipan and had my first ever contact (on the MKARS80) with a station in the Czech republic I don't think the radio is well suited to this mode.

The problem is that PSK31 along with CW and other digital modes have a higher duty cycle than plain speech SSB, this causes increased heating of the circuit board which in turn induces frequency drift through warming of the Polyvaricon.

If you did want to try PSK31 it may be worth housing the radio in a larger case, I have also heard that small fans have been used to keep the "internals" at a more even temperature when on digi modes but don't have any experience of this myself.

Regards,
Steve G6ALU

326. Slow Progress

Yahoo group: mkars80
Date: 2008-11-12 01:14:15 UTC
From: Paul
Topic: 326 Message: 326

Hi All,

Uploaded some photos (awaiting approval though) of my kits progress.

It's a bit slow going as it is the first kit I have built other than morse kit for my 2E course, but getting lots of advice and some assistance from my local clubs which is good.

Think I am over half way though.

My uncle who got me interested in the hobby passed away in Feb this year, but I am sure he would be amazed I even attempted it.

Anyway, apart from downloading the wrong manual, and worried about the windings, so far haven't been any major problems.

Only hope when the day comes to add power to it, it works.

Will keep pressing on during these cold winter months, and thanks to the Steve & Milton Keynes club for the best way I have spent £45 in the hobby this year!

From: Steve drury
Topic: 327 Message: 328

Hi Alan,

I have loaded an updated version of the manual into the files section (V1.2), this is completely compatible with version V1.1 radios as the only changes have been clarifications and error corections.

V1.2 manual is NOT compatible with V1.0 radios, I will add these to the file section later.

Apologies for the inconvenience I will do my best to get the original site re-instated and will probably have the files linked to my site directly.

Regards,
Steve G6ALU

Hello All,

Apologies for the problem with MKARS documentation download this has resulted due to a change of MKARS web site.

I will reinstate the old page containing MKARS down load documentation tomorrow (13 Nov) and will advise accordingly.

This was out of the control of Steve G6ALU, my apologies for any inconvenience caused.

I like your pictures Paul, colouring in the components on an overlay as you procede seems a good idea, it certainly helps you keep track of what you have fitted.

If any one has more pictures they are free to upload them to the site, I (and many builders) are always interested in different cases etc.

Hi Steve just finished my mkars80 kit which I purchased at the Leicester Radio Rally and pleased to say it all works ok, just a couple of things which may help other builders, I fitted a chassis mounted BNC socket to my case and then soldered short lengths of wire to the PCB this makes it much easier to remove the PCB if needed and also helped me mark out the underside of the case for the controls etc Instead of making the display plug and play I've fitted short lengths of wire to the PCB and LCD display about 2.5" long and fixed the display to the case with PVC insulation tape making sure there were no shorts first, and just a little problem I had with the tuning range, I could not get the frequency above 3.55Mhz but by closing together the windings on L5 the radio now tunes across the full 80M band and then a blob of epoxy glue to keep the windings in place.
I'm only using the radio on receive as I am learnig morse code and this is perfect for that plus I dont have a "proper" aerial up at the moment just a long wire, but I've been listening in on "Italian" amatuer stations over the passed few nights with ease.
I'll post some photos when I've finished the front case etc
Thanks for a great little kit
John G7UYJ.

Hello John,
I'm not sure why you had to close the turns up but if it works leave it -
did you check the number of turns?

Before modifying I advise everyone to build as intended, at least then you
know it should work!

I look forward to seeing the photos John.

Hi steve thanks for the reply, I'm sure I had the correct number of
turns it may be that I didn't wind them tight enough and like you say
build as per instructions you know it's right if you do.
Then find out why it's not working.
Once again thanks for a great radio kit.
John G7UYJ

337. MKARS80 net?

Hello Folks,

It would be really nice to QSO with other MKARS80's so how about starting an MKARS80 net?

I appreciate whatever time is suggested unfortunately there will always be those who cannot get to the MKARS80 for whatever reason but I think over a weekend is best so how about next Saturday 22nd November at 15:00hrs UK local, Frequency 3.730?

Hope to work a few of you.

73 John (M0TIF)

Hi All

I have my mkars80 up and running and have had good on air reports. Its a really nice rig. Thanks to Steve for his help with a couple of queries. A net is a great idea.....what about 3.700 + or - ?

It worked!

I logged the following stations on the NET this afternoon:

Alan GB2BP (2E0GLD) Bletchley Park Milton Keynes
Dave G0BVV South Coast (Bracklesham Bay?)
Ted G4OZG Kings Lynn
Calvin M1EPM Milton Keynes
Jack G3NEH Milton Keynes (40ft long wire)
And me Steve G6ALU Milton Keynes

We will perhaps try a net again in the future but a bit earlier in the day,
unfortunately European stations caused QRM towards the end of the net.

Thanks to all who took part and those listeners.

Topic: 344 Message: 344

hello all first off may i say what a wonderful kit. it was a pleasure
to build

i hoped to be on the net but i created a problem with my kit and
could do with some help please.
all was working ok on the rx side of things and was just starting to
set up the tx side when it happed i dropd my screwdriver on the pcb
and shorted something out . the problem i now have is i can receive
signals when r 2 is set to its minimum but as soon as i turn it even a
fraction i lose the audio/receive audio output any ideas would be
very much appreciated as aim not to hot on circuits
many thanks

Steve,
I think I have has this before, what may be happening is as follows:

Q1 has failed and gone leaky from Drain to Gate, this causes volts to flow from Drain to Gate, through R2 (when its not fully ant-clockwise) and through R6 into the TX12V rail. Fed from this supply rail is the audio mute transistor Q3, to confirm measure the voltage on Q1 gate terminal (1st from the left); when in receive this should be very low. Also check the base voltage on Q3; this should be low (<0.2V) on receive.

If this has happened send me your address to my mail direct g6alu@... and I will send you a new IRF510 and the 10k bias pot (R2), its no safe to re-use this preset resistor as it is likely to be burned out t the low end.

Regards,
Steve G6ALU

Topic: 344 Message: 350

hi steve thanks for your reply about my receiver problem i have tested
the voltages you pointed out and they are on q1 gate the voltage with
r2 fully anti clockwise is 4.8 volts and when you tun r2 a fraction
the voltage jumps to 9.5 volts
the voltage on q3 base is 0.2volts on receive i guess that q1 has
indeed gone leaky and r2 has burnt out if you could send replacements
and let me know the cost i would be most grateful
many thanks
steve

352. Introduction. M1KTA

Yahoo group: mkars80
Date: 2008-11-26 09:43:51 UTC
From: dombaines
Topic: 352 Message: 352

Hi all,

Just joined the group.

Bought a kit at Leicester Rally and will start it at some point this Xmas. The reverse tuning is a bit odd.

QTH is c40 miles East of MKARS/Betchley Park, locator JO02bd in a little village called Stapleford.

Looking at it so far I can see an experiment with a slightly larger case using an air spaced variable and a reduction drive for tuning or might try the varicap mod with a 10 turn pot, add an intyernal speaker, power switch, add a battery holder for AA rechargable batteries, an L match ATU for /P use (I find the W3EDP antenna works well for 80m) and finally just have to paint it some luminous/gawdy colour scheme.

After spending last year in HB9 I discovered the benfit of using lock 'n' lock boxes for homebrew in cold & wet /P conditions so might investigate using one.

The blog we all seem to have these days (mine is http://m1kta-qrp.blogspot.com/2008/11/mkars-80m-tcvr.html) will contain details of the build.

353. Modifications

Yahoo group: mkars80
Date: 2008-11-29 17:00:06 UTC
From: bcjazz50
Topic: 353 Message: 353

Hi All, A great little kit, so thanks Steve.
Mod 1. Changing C59 and 60 from polyester to POLYSTYRENE
dramatically reduces the VFO drift.
Mod 2. By removing the Tuning capacitor and replacing it with a 10
turn 10K pot and 2 MVAM109 diodes in series makes tuning really
easy.Approx 100pf is needed to couple to the original Tuning
Capacitor point.A 1 meg resistor provides an earth connection, from
the junction of the top diode and the 100pF coupling capacitor.The
tuning voltage is fed via a 470K resistor from the 0.1uF capacitor
decoupled slider of a 10 turn pot. where the diodes are connected
togeter.
One end of the pot goes to the +8V stab . rail and the other end of
the pot is earthed. Get it the right way round means clockwise
rotation of the pot increases the 3.6 MHz frequency to 3.8 Mhz
Series Varicap diodes are connected together at their positive
connections, this is the 470K control voltage point and one neg. end
goes to earth, the old tuning cap earth connection, the other neg.
diode end going to the 1 Meg to earth Resistor and 100 pf point.
Good luck all
73

From: bcjazz50
Topic: 354 Message: 354

Hi
Some words for guidance re Messagage 353.
Polystyrene Capacitors have a colour coded end, being tubular, that denotes the outer foil. This should always be connected to the lowest RF potential, e.g OV or earth if possible or as near.
The top coupling capacitor, from the Varicap. comprises a Ceramic NPO 22pF in parallel with a polystyrene 82 pF capacitor. Low value NPO capacitors usually have a black panted top.
Series connected MVAM109 diodes are connected this way to prevent forward conduction, due to high circulating RF voltages, that can cause spurious responses and thus strange effects. MVAM109s are used in Medium Wave designs so series connection halves their effective Capacitance swing which is fine in the narrow band MKARS80 application.
I hope this of use/interest.

356. MKARS80 VFO Stability - A significant improvement?

Yahoo group: mkars80
Date: 2008-12-05 20:39:22 UTC
From: Steve Drury
Topic: 356 Message: 356

Evening all..

Following the modifications posted by Brian G8DIU I thought I would check out his modification of replacing the 1nF polycarbonate capacitors with polystyrene types, these were kindly donated by Ray G4TZR.

Firstly I logged the drift from start-up to a stable operating frequency, this took about 30 minutes and drifted a total of 7kHz - mainly in the first few minutes after switch on.

I replaced the capacitors, adjusted the orange trimmer for correct coverage, re-assembled the radio and allowed it to rest un-powered for about 2 hours. Next step was to plot the drift over a 30 minute period from switch on... it didn't! At least the huff and puff held the radio around the centre of its range during this period. I then transmitted for several minutes into a dummy load and was pleased to find the huff and puff still held it on tune.

The test needs repeating once the radio has been switched off for a longer period but the results do look encouraging - this came as a surprise as I had tried polystyrene capacitors on the first prototype when they gave similar results to the specified polycarbonate types.

If this mod does provide a significant improvement (and it looks likely) it leaves me with a problem, 1nF polystyrene capacitors are around 1 UK pound each, this cost can't be absorbed in the kit price so I have two choices: Sell the kit as is and offer the capacitors as an up-grade or alternatively increase the cost of the kit.

I will provide an update when the radio has been run from cold and air tested.

Thanks to Brian and others who have experimented with VFO stability.

Steve G6ALU

Topic: 356 Message: 358

Hello all,

After reading Brian's post I switched on my soldering iron and rushed off to my local electronics store to buy a few of the miracle capacitors. And... they work, indeed!! No more retuning, no more lost QSO's and this for only 5 Euro's and 10 minutes of work.
Thanks very much Brian (and Steve)!

73's Ron de pa0rcl

Steve, found an old rather large 1nf poly in the junk box, temporary fitted it and has cured the problem here which is great. Will do a few tests with an oscillator to see if it copes with CW now, I sure hope so as that will be a real bonus :-)

I personally think adding a couple of GBP to the kit price is well worth it as its still absolutely excellent value for money.

Oh and many thanks to Brian for sharing this fix with us.

Hi John,

I have 2 of the poly caps, that I have been giving to club members, put to one side for you. (They are just the right size)

I have modified my MKARS80 today and the increase in stability is quite marked. A 20min qso with Allan at GB2BP resulted in no drift even after long overs.

Ray

Looking at the temperature coefficient of polystyrene it looks as though
they aren't as good as ceramic:

BC components (1nF 50V) ? 30PPM / ?K
LCR polystyrene (1nF 250V) -110 +80PPM / ?C

Both components could exhibit positive or negative temperature
coefficients - I will get samples of each type and try them out.

Hello Steve,

I've replaced C59 and C60 of two of my MKARS80's today. After the modification they are rock stable. This mod is a distinct if not dramatic improvement and I believe the extra cost is well worth it.
My advice would be to increase the price of the kit as to account for the more expensive caps.
I've informed some of my fellow hams in this country about the subject mod. There will probaly be a rush om polystyrene caps next week, they are not that easy to get!

Thanks and 73,

Ron pa0rcl

Thanks for the message Ron,

The problem originated from me trying to get the best value for money from components used, I'm afraid in this instance I may have gone too far! It is best practice to use polystyrene (or other low temp. coefficient) capacitors in the VFO but I had assessed the stability to be adequate with the low cost polycarbonate types without realising the improvement possible.

As I mentioned before I had used polyester types in the prototype for C59-C60 but I probably used standard ceramic types elsewhere so didn't realise the benefit.

A lesson for all of us!

Steve G6ALU

Hello All
I joined this group earlier this week and Steve has since sent me a kit
which I started to assemble last night. I had soldered all the components from bag 1 to the PCB last night (including the Polyester caps for C59 and C60) before I read these messages but will no doubt substitute these for polystyrene or ceramic NPO later. I have previously built two BITX20 rigs both of which use Polystyrene caps in
the Colpitts VFO and I have not experienced any drift problems using them in spite of the fact that I don't employ a H & P stabilser.
I aim to assemble at least one bag an evening so I hope to have the MKARS80 up and running before Xmas.
I very much like the way you have packaged your kit Ron and I would be
interested to know where you sourced your cabinets and wonder if you would photograph and publish some pictures of the interior of your transceiver in the files section of the group sometime.
Thanks to all for your help de Charles G3OTH

Hello Charles,

I've scored the cabinets at their local importer here. The come from Italy, from a company called Cientsolution. Apparently they don't make these cabinets any longer, which is a pity because they are actually very good and the MKARS80 just fits in them. You may be able to still find them in the UK, the ref. nr. is TM55155, a so-called mini-case. You might just Google these terms.
The MKARS80 in the pictures I've posted earlier is my first prototype. It doesn't look al that nice inside but I'll post some more pictures next week, after I got my camera back from one of my children, hi.

Good luck building and 73

No sweat, Steve, I mnyself had overlooked these caps and believed
that L5 was the main culpritt. I did not even realise that the green
caps were at the origin of the problem when I saw that the BitX20 I
built uses polystyrene caps in the VFO. I just failed to make the
link. Fortunately, other group members did. Indeed a lesson for all
of us!

367. Can any one help?

Yahoo group: mkars80
Date: 2008-12-06 20:24:03 UTC
From: Steve Drury
Topic: 367 Message: 367

I've been asked for three services which I am unable to provide:
1.. To provide ready drilled cases - some constructors either don't have the required skills or facilities to cut / drill the apertures.
2.. To provide ready wound inductors - winding the coils is difficult for those with arthritis etc.
3.. To provide a fully built kit.
If there are group members who are prepared to provide any of these services please reply on the group, assistance would be based on the Elecraft model - the customer deals directly with the service provider not through me! Any costs should be agreed directly between both parties.

If any one wants to come forward I will put there details in a text file in the files section for easy reference.

Any takers?

Steve G6ALU

Hi Steve,

I think to further the good name of the MKARS80 you should supply the parts
and increase the price of the kit.
I am sure with an explanation on the MKARS80 front page people will be more
than happy to pay the extra, it maybe good to sell the parts as well for
those who would like to upgrade but can not get the parts.
I reckon with your excellent sourcing skills you may find something cheaper
(no pressure :)

VFO Stability - an update

I received my component order which included 2 types of 1nF capacitor - NP0 ceramic and polystyrene.

Both types of capacitor have been compared directly against each other, polystyrene types were fitted to my original prototype and the ceramic capacitors fitted to a new radio just finished. I allowed both radios to adjust to the ambient temperature then applied power simultaneously, reset the frequency to 3.7000 MHz and observed the drift:

New radio fitted with ceramic 1nF NP0 types in positions C59-60
Throughout the warm up period (half an hour) the frequency didn't drift, the huff and puff indicator remained in the centre of its range. After this time I injected a tone in to the microphone socket sufficient for 4W output power, the radio was left transmitting continuously for 10 minutes after which the huff and puff had come near the end of its range (bar to right).

Old prototype fitted with polystyrene capacitors
After half an hour from switch on the huff and puff indicator was near the right hand side showing all the huff and puff range had been used, the VFO though was still on the correct frequency. After the warm up period I reset the tuning bringing the huff and puff indicator to the centre and injected a signal as with the other radio. After transmitting continuously for 10 minutes the indicator had moved one bar to the right, I left it transmitting for another 10 minutes after which time the indicator was at the left hand end; shortly afterwards the huff and puff lost lock.

Conclusion
Both types of capacitor improved the VFO performance considerably but had different characteristics, the ceramics giving little change during warm up but some drift during transmit and the polystyrene drifting during warm up but becoming more stable with an increase in temperature. This suggests that the polystyrene capacitors were compensating for changes in other components.

Both types should give a good performance in normal use I'm most likely to use the ceramics as they are much cheaper and fit the PCB properly.

I'm now watching pictures transmitted by ONKUA using the DRM mode.

I want to keep it simple Nigel, what I didn't say is that the effect is likely to be different for everybody due to the temperature coefficients of components used, I will leave it up to the huff and puff to keep things under control.

372. MKARS80 PCB assembly successfully completed

Yahoo group: mkars80
Date: 2008-12-11 19:43:36 UTC
From: g3oth
Topic: 372 Message: 372

Hi All
Last night I successfully completed assembly of the PCB of the kit which I received from Steve last Friday. The kit supplied was complete in every detail and the documentation excellent, unambiguous and free from errors. Thus assembly went very smoothly and I have been able to complete and bench test it after only six evening's work.
So far I am impressed with the performance of the receiver, particularly the readout and stability of the H&P stabilised VFO, although being new to this facility I need conduct more practice with my tuning technique. The VFO was easily setup with more than 50KHz to spare at the band edges of 3500 and 3800 KHz and surprisingly even without a large knob or slomo drive the Polyvaricon coarse control alone with care can tune in SSB without resort to the fine tune pot.
The LSB filter sounds nice and appears to be working as it should.
Before I permanently soldered in the BFO and Filter Xtals I took the opportunity to test all of them using the BFO circuit of the MKARS as a "test jig" a la G3UUR's technique as mentioned on page 3.19 of Experimental Methods in RF Design by Wes Hayword et al.
For those of you interested the results I obtained from the 5 Xtals supplied in Steve's kit measured with and without a series capacitor of 40pF were as follows.

Xtal 1

Fosc = 10,000.146 KHz with 40pF series C, Fosc = 9,998.280 KHz no C.

Xtal 2

Fosc = 10,000.173 KHz with 40pF series C, Fosc = 9,998.293 KHz no C.

Xtal 3

Fosc = 10,000.191 KHz with 40pF series C, Fosc = 9,998.327 KHz no C.

Xtal 4

Fosc = 10,000.174 KHz with 40pF series C, Fosc = 9,998.298 KHz no C.

Xtal 5

Fosc = 10,000.128 KHz with 40pf series C, Fosc = 9,998.279 KHz no C.

It can be seen from the above that Xtal 3 has highest Fosc and for this reason it was chosen as the BFO carrier Xtal.

All four remaining Xtals were within 46 Hz and 19 Hz of one another for the two conditions of test, and these were used to construct the LSB filter.

Using a value for delta F of 1866 HZ obtained from Xtal 1,

From: g3oth
Topic: 372 Message: 373

CONTINUED from last message, sorry about the glitch!

Using a value for delta F of 1866 HZ obtained from Xtal 1, the
motional capacitance Cm from G3UUR's equations turns out to be around
15fF and Lm around 0.017 H.

These results would therefore indicate that the Xtals provided in the
kit are ideal for purpose.

Well done Steve and many thanks.

I'm glad you are happy with the kit Charles, I must confess that there
wasn't as much work put into the filter design as you have made checking it!

VFO stability can be improved considerably by replacing the feedback
capacitors C59 - C60 with polystyrene or NP0 ceramic types, I will offer
this upgrade shortly.

Have fun,

Steve G6ALU

Shall we try a net this Sunday?

We found that 15:00 UTC was a bit late so I intend to hold a net on 3.7000 MHz at 14:00 UTC this coming Sunday 14th December.. all welcome!

Steve G6ALU

Further to the last update:

I arrived home to a cold shack this evening and turned on both transceivers at the same time, the one fitted with ceramic capacitors again didn't drift from the initial setting so I've decided this is the way to go.

As the capacitors are low cost I will supply them free of charge but I leave it to you to pay the postage: If UK owners would like to send me a stamped addressed envelope I will send two capacitors wrapped in a mod sheet, this should be less than the 5mm thickness required for a normal stamp.

I will advise the cost to overseas owners once I have weighed and costed an envelope. Capacitors should be with me by the weekend.

Shall we try a net this Sunday?

We found that 15:00 UTC was a bit late so I intend to hold a net on 3.7000 MHz at 14:00 UTC this coming Sunday 14th December.. all welcome!

From: g3oth
Topic: 372 Message: 379

FB Steve,
I have spent a couple of hours tonight tuning around 80 meters with the MKARS80 attached to the classic piece of wet string draped around the picture rail (actually an uncoiled roll of hookup wire about 30 feet long 6 feet high extending from the kitchen to the living room) and have copied many SSB and CW signals from Europe with excellent results and stability in spite of the fact that the PCB is open to the elements and lying on the table without even the advantage of tuning or gain knobs.
I have just about mastered the art of tuning with the H&P now.
I had thought about eventually repackaging the kit and using either an air variable or varicap potentiometer tuning but that was before I experienced the surprise and pleasure of using the kit with the polyvaricon as is, so I doubt whether I ever will now.
I have some small 1200pF polystyrene caps here which I might try later as replacements for the C59 and C90 polyester types.
My priority now is to check out the transmitter with a heat sink into a dummy load and to get a decent 80 meter antenna erected to put this little gem through its paces.
One question for you. How easy would it be to use or reprogram the existing PIC to enable this circuit to be revamped for 160 meters. It seems to me that if one were to alter the IF and VFO constants randomly to get on Top Band then the clock frequency of the PIC would be altered, presumably resulting in an odd ball tuning step increment as well as a false readout. Your comments would be welcome on this subject.

Thanks Steve, just read your message, I will take up your offer later.
Meanwhile for anyone interested I have been running the PCB on
receive from an eight AA cell Nicad pack all evening and it is still
going strong with only 9.9 volts indicated on the LCD screen now.
Quiescient current is about 96 mA at this level.

Morning Charles,

Yes it would be possible to modify the PIC code, have you thought about an ideal IF frequency?

382. Re: MKARS80 VFO Stability - A significant improvement?

Yahoo group: mkars80
Date: 2008-12-12 19:48:11 UTC
From: Liz & Tony Buckland
Topic: 356 Message: 382

Hello Steve,

I replaced C59 & C60 with a couple of ceramic caps I had here and tried it on the air last night and although it was an improvement it was not as much as I thought.

This morning I switched it on from cold and after 30 minutes it had drifted 11.7K, I must be using a different type of ceramic cap than you are?

Hello Tony,

They must be special NP0 type capacitors, I will load both rigs with them to make sure I'm right - you have seeded doubts! Standard 1nF ceramics will be X7R dielectric (or worse), this isn't suitable for use in VFO circuits as the temperature coefficient is high.

From: g3oth
Topic: 372 Message: 384

Good evening Steve
Just read your msg as I have been out all day here.
FB abt the feasability of doing a PIC for Top Band.
I have not gone deeply into the pros and cons of VFO versus IF for 160 meters but some ideas come to mind which might be worth examining further.
Given that some redesign of HPF and LPF networks and maybe HF transformers would need to be done in any case for 160 meters no matter which scheme was chosen then one of the following might be considered.

First of all one could stick to an IF of 10 MHz and up the VFO (currently 6.2 - 6.5 MHz) to 8.0 - 8.2 MHz thus tuning 2.0 - 1.8 MHz backwards as at present.
The advantage of this would be that no redesign of the current LSB filter would be required nor presumably your code re tuning step increments as the BFO and PIC clock frequency remains the same, the required VFO frequency could be easily raised by simply reducing turns on L5 by about 40% from 40 to say 25 for starters and increasing the padding slightly across the polyvaricon to restrict range and thus further improve bandspread. One might argue that increasing the VFO frequency might encourage more drift but the percentage increase is not that large and is compensated somewhat by the fact that the required range is less and more padding capacitance could be employed, the H&P could probably take care of this in any case. Remembering that Yaesu first used a 8.4 to 8.9 MHz and later a 8.7 to 9.2 MHz analogue VFO in all their HF rigs and Atlas Radio even higher, then I can't see any real problem realising this.

A second suggestion might be to consider using a 5 MHz IF.
Xtals are readily available and could be used to construct a LSB filter, what shape this would take with existing ladder components would need to be investigated however. Required VFO would have to be lowered to 3 to 3.2 MHz, again tuning backwards, requiring about four times as many turns on L5 (not a very nice prospect) if polyvaricon and current padding constants are retained. Stabilty would not be a problem and maybe by using exactly half the current IF and BFO frequency the resulting clock ratio and code could be easily altered to retain 25Hz tuning steps.

Finally one might consider using 5 MHz Xtals to construct a USB Filter, but again this would be unknown territory. However a VFO of 6.8 to 7.0 MHz would need to be employed and since this is not that far away from what you are using already there should be no problem there, but this time we would experience FORWARD tuning which some might say is more acceptable. Sideband inversion means that LSB will

still be resolved ok on Top Band. As to how this relates to your code though I cannot make a judgement.

Spurs generated using any of the above would need to be investigated of course before going any further. I have found some bad spurs with my BITX20A using a 11 MHz IF and 3 to 3.350 MHz for instance. As a result of this there is a spur program in the BITX20 Yahoo group files originated by Dan Tayloe N7VE, which I later ammended that I could use to investage these choices if it is of any interest.

Meanwhile I have yet to package up this MKARS80 and finish off some Softrock projects let alone start on the STAR PCBs !

BTW Ron PA0RCL if you are reading this, thanks for your info last weekend on your case but I have been unable so far to find anything about the Cientsolution company on the web.

Steve, I hope to be on the net. Different aerial, /P holiday multiband aerial mounted on my balcony handrail, maybe someone will hear me this time.

Regards, Charlie

Shall we try a net this Sunday?

We found that 15:00 UTC was a bit late so I intend to hold a net on 3.7000 MHz at 14:00 UTC this coming Sunday 14th December.. all welcome!

Another successful net this afternoon although band conditions were poor, down in my log I have:

Me (Steve) G6ALU - Milton Keynes
Ray G4TZR - Milton Keynes
Charlie M0AIJ - Milton Keynes (short antenna)
Ted G4OZG - Kings Lynn (nice and loud!)
Calvin M1EPM - Milton Keynes
Ken - G0WKN Spalding
Dave - G0BVV Bracklesham Bay

Thanks to all those who participated this afternoon especially Ken who I believe had just completed his transceiver.

It was suggested we should try a morning slot for the next net, perhaps around 8AM next Sunday?

Hi Steve
Heard you put out a call at exactly 1400 and copied you up here in Northumberland most of the time up until 1430 at Q3 to Q5 on my newly completed but unboxed MKARS80 sitting on my knee attached to a 12 volt DC Wallwort and a 30 foot downstairs indoor antenna hung around the picture rail. I could just hear Charlie, Ray and Ted but you Steve were much stronger, note no improvement to signals detected when copied on my main RX. Hope to get it into a box and try out the TX later on this week.

Hi Charles, glad to hear it works OK.

With the weaker stations I tried to listen with my Pic-A-Star but despite pressing buttons and twiddling knobs I couldn't resolve them any clearer!

Hope to hear you on the next net.

From: pa0rcl
Topic: 375 Message: 390

Hi all,

Just wanted to let you all know that I listened this afternoon on 3.700.000 with one of my MKARS80's and indeed heard some distinctly Britsh male voices. The signals were weak, in the order of S3 and I could'nt distinguish any call. I could, however, copy odd parts of QSO's with some difficulty. My QTH is in het east part of the Netherlands, near the German border.

Good luck and 73

Ron pa0rcl

Subject: Re: [mkars80] MKARS80 net

Another successful net this afternoon although band conditions were poor,
down in my log I have:

Me (Steve) G6ALU - Milton Keynes
Ray G4TZR - Milton Keynes
Charlie M0AIJ - Milton Keynes (short antenna)
Ted G4OZG - Kings Lynn (nice and loud!)
Calvin M1EPM - Milton Keynes
Ken - G0WKN Spalding
Dave - G0BVV Bracklesham Bay

Thanks to all those who participated this afternoon especially Ken who I
believe had just completed his transceiver.

It was suggested we should try a morning slot for the next net, perhaps
around 8AM next Sunday?

OK FB Steve
Just out of interest did you note your readout frequency
I think I copied you best at 3699.975 on my dial. It would be useful
to know how far out I am with my current settings here.

Hi Ron,

Perhaps if the conditions are more favourable you will be able to
participate next time.

I was set to 3.7000 MHz but others may like to comment, especially if they
are using "known" accurate VFOs!

Fb Ron,
Well I think perhaps that you and I are probably about the same distance away from Milton Keynes so that is the reason we dont copy some of the stations so well.
I have my MKARS80 wkg ok and am very pleased with the results.
Did you manage to get your camera back from your daughter yet to take some more photos of inside of your rig.
I have posted some pictures of my progress in the Photo section, I probably will just use the supplied aluminium box for the time being as I dont think I will need to have a need to improve on the Polyvaricon simple method of tuning after all, which is quite a surprise for me, as the H&P is working so well.

395. Re: [mkars80] Re: MKARS80 net

Yahoo group: mkars80
Date: 2008-12-14 15:26:30 UTC
From: Chris Harmer
Topic: 375 Message: 395

Steve:

You were 37010 on my FT-817ND. I have to plead guilty to not having built my kit yet due to other pressures, so I only listened! For info, located at Nailsworth in Gloucestershire, halfway between Cheltenham and Bath, using a ZS6BKW version of the G5RV, tuned to 1.1:1, and listening on the FT-817, reports were (1400 to 1415UTC):
Noise floor S3 to S5.
G6ALU S6 min, S9 max, typically S8.
G4OZG S6 min, S8 max, typically S7
M0AIJ no copy.
M1EPM S7
G0BVV S6
Another G0, call not copied, S7
The rest were not readable.

Regards, Chris M0HMR.

I was set to 3.7000 MHz but others may like to comment, especially if they
are using "known" accurate VFOs!

Topic: 375 Message: 397

Steve yes it would be useful to know if anyone has access to a
standard to compare our settings. You sounded ok on 3700.000 KHz but
I thought I got better copy when I dropped down 25 Hz.
Am I right in assuming that the integrity of the frequency readout
would be optimum when the BFO and hence your PIC clock is set to
exactly 10,000.000KHz ? If so then I assume that if one is after
precision of readout then that would be the way to go, therefore
there might have to be a compromise made if one wanted to match the
BFO to the filter characteristics for best voice reproduction, or can
your software take care of this somehow ?

398. Re: [mkars80] Re: MKARS80 net

Yahoo group: mkars80
Date: 2008-12-14 15:37:52 UTC
From: Steve Drury
Topic: 375 Message: 398

Charles,

The PIC clock may not be set to 10.00 MHz as it comes off the CIO (BFO),
mine is set a littel below that figure. The PIC code compensates for this.

Steve G6ALU

From: pa0rcl
Topic: 375 Message: 399

Yes Charles, I managed to pinch it back today and will take and post
some pictures of my first MKARS80's innards tomorrow.

[Non-text portions of this message have been removed]

400. Re: MKARS80 net

Yahoo group: mkars80
Date: 2008-12-14 16:03:30 UTC
From: g3oth
Topic: 375 Message: 400

Steve, I am not quite clear as to what you mean.
I realise that the BFO, CIO and PIC clock are the same.
This being the case I cant see how it is possible to fine tune the
BFO to match the filter and expect the clock frequency to say put and
therefore not effect the readout. Please enlighten me if this can be
got around.
Charles G3OTH

401. Re: [mkars80] Re: MKARS80 net

Yahoo group: mkars80
Date: 2008-12-14 16:07:39 UTC
From: Steve Drury
Topic: 375 Message: 401

Sorry to confuse the issue - yes you are correct, if you optimise the BFO
for the filter cut-off the accuracy of the frequency counter will suffer.
The code is set for a frequency lower than 10.00 MHz.

FB Ron I will look forward to seeing them.
BTW I had no luck finding that Italian case source on the web but
many thanks for giving me the details nevertheless.

From: g3oth
Topic: 375 Message: 403

FB Steve, glad we cleared that one up, as I thought one couldnt have ones cake and eat it Hi Hi.
I did notice in the documentation you mentioned 9999.9KHz so I presume your code is based on this frequency for a TRUE readout rather than exactly 10,000.000 KHz
That said it therefore would not seem to be a problem for you to recode to employ just abt any oddball Xtals in the filters, I was thinking abt how it might apply to colour burst types in the context of that Topband idea msg earlier !

Topic: 375 Message: 404

Hi All

Conditions for me on the net this time were not too good.

I heard Steve G6ALU & Ray G4TZR. I heard a couple of others but can not confirm call signs.

I have not fitted the capacitor mod yet and my MKARS80 was only switched on at 14:00hrs so drift was a problem.

Will be on at 08:00 next Sunday.

Another successful net this afternoon although band conditions were poor,

down in my log I have:

Me (Steve) G6ALU - Milton Keynes

Ray G4TZR - Milton Keynes

Charlie M0AIJ - Milton Keynes (short antenna)

Ted G4OZG - Kings Lynn (nice and loud!)

Calvin M1EPM - Milton Keynes

Ken - G0WKN Spalding

Dave - G0BVV Bracklesham Bay

Thanks to all those who participated this afternoon especially Ken who I

believe had just completed his transceiver.

It was suggested we should try a morning slot for the next net, perhaps

around 8AM next Sunday?

Steve G6ALU

Hello Charles,

I've added the pictures of my first MKARS80's innards in my album marked "PA0RCL" in the photos section of our group. You can see them after Steve has approved of them.
BTW, this is the version of the MKARS80 (I have three) with which I do my experiments, so some soldering work and wiring was not done as it normally should be.
Of course I'll be happy to answer any question you might have.

Hello Ron
Thank you for posting the photos of the innards of your special MKARS80, they are very nice indeed and the quality of your construction is excellent.
I particularly like the aesthetics of the design and layout of your front panel, that was the reason I originally asked you about the source of the case, it is such a pity that these no longer seem to be available.

Last night I did some drilling and filing on the standard case that Steve supplies with the kit and I now have my PCB mounted and boxed up, only the IRF510 and LED need to be soldered in permanently now.
I managed to persuade the PCB into the case without elongating and opening up the holes too much and the final result is quite rigid.
I have sent a SAE today to Steve for replacement 1000pF NPO ceramic caps for the Clapp VFO and will substitute these on my PCB when they arrive before I finally batten down the hatches.
I have various old and new knobs here but I have not yet decided which combinations to use to give the panel a balanced appearance.

I will have plenty of questions to ask you later about your experimental version should I decide to make another kit or modify this one.
For instance:
How you back light the Display?
Is this a new or modification of the standard Display supplied by Steve?
Do you notice any extra RF interference being generated by the LCD by using the longer ribbon cables from the PIC and Tuning and RF gain controls?
What components and values do you use for the Varicap Tuning?
How linear is the tuning and what frequency range can you achieve?

I noticed from your latest Photos that you also seem to have added a little "finger dimple button" modification to your Main Tuning knob since your earlier photos, which gives a nice little finishing touch to your build.

Thanks again for your help.

Hello Charles,

Thanks for the flowers. I'm not sure if you want or need my answers to your questions at this stage or at a later instance.
I'll be happy to provide the type number of the back lit LCD and the schematic of my simple varactor circuit, but this only makes sense if you decide to use a somewhat larger case to accomodate the 10-turn pot and the new display.

Enjoy the hobby,

73, Ron pa0rcl

Ok Ron thanks for your reply.
No need for any detailed info at this moment, but it would be appreciated sometime when it is convenient, maybe you could post it in the files section later.
It would appear from what you say that a new LCD is required to get the back light facility,
In the meantime though to satisfy my curiosity perhaps you can comment on my LCD interference and Varicap VFO Linearity / Range questions.

From: pa0rcl
Topic: 25 Message: 410

No problem, Charles, curiosity is one of the corner stones of human civilisation, and hence of radio amateurism.

As for LCD interference; there is none. The LCD is backlit by LEDs not by fluorescent tubes with inverters, that's why.
These backlit LCDs cost in the order of 5 Euro's here. It's not pin compatible with the original MKARS80 display nor does it mount the same way.
Anyhow, I find the back lit display very comfortable to use.

I use the Philips BB112 varicap, just because I had it handy at the time when I wanted to try a somewhat more comfortable tuning method at the time. The BB112's capacity versus applied voltage curve is pretty flat, except at the extremes of the curve. The 10-turn pot is of the linear type (I don't think there are logarithmic types at all), so the linearity of the tuning is pretty good. I never measured this, quite frankly. Good linearity would only be important in the case of a linear scale with a pointer, not with a digital display showing the measured frequency.
The range of the varicap tuning can easiily be adjusted with a small trimmer pot in series with the 10-turn pot and with the aid of the orange coloured trimmer pot on the board. In my case I've adjusted them so that I can tune between 3490 and 3810 kHz. I still use the fine control, since the 10-turn pot is still somewhat too coarse. I've put 100K in series with the fine tuning pot as to reduce its range. The fine control can also be used to readjust the H&P indicator in the centre of its range, should this be necessary.
Perhaps I'll try Jim's idea to split the band up into three switchable 100 kHz ranges that can be individually tuned with the 10-turn pot, thus making the main tuning button three times more accurate. This may make the fine tuning pot superfluous so that there's room on the front panel for a three-position switch. I'm not sure if this would be a step forward, however. So far the fine tuning works fine, so to speak, hi.

Perhaps I'll post the schematic of my varicap circuit in the files section of our group after I've converted it into JPG-format. There is really not much to it, it's only a few components.

Ron thankyou for the info.
Ok abt the substitute LCD and not experiencing any noise, I was concerned in case the ribbon cable carrying the multiplexer switching waveforms might radiate and be picked up by the RX, but I guess the currents are so small that they must not create a problem. I know that with some multiplexed LED displays which use a higher current you have to be careful about where you place them.
Fb abt the varicap. It is good to know that you can achieve the full band range without resort to switching in extra padders.
I haven't done much work on my MKARS80 since my last post, but instead have been listening to DX from USA, VK and ZL on it with just my indoor antenna so am very pleased with it's performance so far.
It is very quiet without an antenna attached and all discernible birdies are very weak and completely disappear into the atmospheric noise when a small antenna is attached.

Good Morning Steve
I could just hear you here in Northumberland on indoor antenna with
my MKARS80 this morning.
Signals were not as good as last week, I heard Andy using his G5RV
well but all others apart from G3Z?? using 15 watts and RXing on his
FR400 were down in the noise.
Displayed QRG was 3700.125KHz today, but I have been messing abt with
my BFO since last time.
NPO Caps still in post, but PCB boxed up and IRF510 now soldered in.
Using 13.6 volt PSU I measured TX quiescient with cut off bias = 250
mA, and with correct bias 300 mA and abt 5 watts out into Car
sidelight (naughty naughty) when I tried it out first time last night.

All sounds OK Charles... sorry you didn't get the capacitors but I think
they were only sent Thursday if I remember right.

On the net today were:

Me (Steve) G6ALU - Milton Keynes
Calvin M1EPM - Milton Keynes
Ray - G4TZR - Milton Keynes
Ted G4OZG - Kings Lynn
Dave G3ZPA - Milton Keynes (15-40W commercial radio)
M3ZPX Andy - Leighton Buzzard (10W commercial radio)

Thanks to all and other listeners.

The band was very noisy due to QRM from Europe, it may be better to start
the next net around 9:30 UTC, Europe will be quiet but we should also miss
the start of the other UK nets.

Hello Steve,

This morning I rose early to try and log into the MKARS80 net with my MKARS80. I heard no one of you all, indeed because of QRM from the Continent. Will try again next week.

BTW, I'm surprised to read between the lines that the UK is no longer part of Europe. Are those in Brussels, aware of this?

Best wishes,

Ron pa0rcl

GM Ron
Yes we must be more careful in future how we refer to our friends
across the North Sea (or German Ocean as we called it 200 years ago)
better to call them "Continentals" perhaps, that way we preserve our
identity and dont offend Brussels! What do you think Steve ?

423. Computer headset and boom mic

Yahoo group: mkars80
Date: 2008-12-22 07:53:23 UTC
From: dombaines
Topic: 423 Message: 423

Hi Steve/all,

Spent some of the w/e in the shack and have all but completed my MKARS 80m tcvr (vanilla without any mods) apart from putting into a box.

What are people using for mike and head phones? thinking about using an old (but new and unused) computer headset and mono boom mike. No cheap mics left at pound shop (as per one in use at Leicester rally).

Hi Dom,

Its not fussy with regard microphones, just make sure its an electret - all PC ones are to my knowledge.

One warning - be VERY careful with headphones as this transceiver doesn't have AGC, if you stumble across a local station with the gain turned up it could hurt your hearing. I've not tried it but you could put a couple of 2V4 zener diodes back to back across the headphone lead with a 100R resistor in series with the radio this would limit at about 3V P-P about the same as an old walkman.

427. Poor output

Yahoo group: mkars80
Date: 2008-12-22 23:15:32 UTC
From: Jerry A Bligh
Topic: 427 Message: 427

Hi Steve
I think I may have a minor problem, your advice would be helpfull.
The radio is now complete and as I had some caps I have carried out
the mod and it is now very stable.
The snag is I modded a mic and it transmits fine when the button is
pressed, but as making contact to the UK from my shack can be
difficult I monitored the output on another receiver and its awful it
sounds hollow and echo's. The other significant indication is that
regardless of the level of my voice the modulation LED always remains
the same.
I am beginning to suspect the mic, is there any way of proving the
radio without getting a new mic as we don't have a pound shop here?
May I also take this opportunity of wishing you all the seasonal
greetings and please keep up the good work.
Regards & 73's

Jerry,
You don't need a pound shop microphone, any electrect mic should do - a PC head-set for instance.

I wonder if you were simply getting feedback? The LED not extinguishing does sound like a problem though - can you confirm PA bias and mixer balance has been set according to the instructions? Do you get any power indication on an SWR / power meter?

429. CW adapter

Yahoo group: mkars80
Date: 2008-12-22 23:40:11 UTC
From: Steve Drury
Topic: 429 Message: 429

Now with the capacitor mod we have quite reasonable VFO stability, I'm considering designing a CW adapter; CW can be generated by simply injecting an audio tone into the microphone socket, to avoid images and key clicks this tone has to have controlled rise and fall times and also has to be clean (low harmonic content).

Target specifications are as follows:
a.. Stand alone unit which plugs into microphone and speaker sockets of MKARS80, microphone, speaker and key then plug into module.
b.. 12 power feed via DC socket
c.. CW band pass filter on receive as well as TX
d.. Switching from SSB to CW by push switch.
e.. Pre-set adjustments; CW tone frequency, hang delay, side-tone level.
f.. Side tone set to 700Hz, adjustable over a small range (possibly 600 - 800Hz)
g.. TX output level by potentiometer; easy to set - just adjust so modulation LED goes out.
h.. Built in limiter for headphone use with a dedicated headphone socket
i.. Unit can also be used stand-alone as a practice oscillator - waveform is nicely shaped so sounds good.
j.. Intention that unit is built into an extension speaker.
k.. Target price 15 - 20 GBP.
I'm looking for comments please.

I forgot Jerry!

Best to try a different microphone - I can't think why it would sound hollow
apart from feedback.

Hi Steve

With your cw adaptor could you consider incoporating this stuff?

SAME SIZE BOX AS ALREADY USED

BATTERIES TO GIVE 13+ VOTS MADE FOM AA Ni-MH AND CHARGING PLUG

WALL WART CHARGER (INTERNAL OR EXTERNAL)

LOUDSPEAKER

TWIN T OSCILLATOR NICE CLEAN AND SIMPLE

AUTO KEY (I DON'T LIKE IAMBIC BUT MULTI-MODE KEY OK)

MECHANICAL PADDLE (I USE A PRINTED CIRCUIT BOARD TYPE VERY RUGGED WHEN MADE PROPERLY)

THE MIKE WHICH COULD BE POSITIONED ON THE END OF A CHEAP TELESCOPIC AERIAL

This would give you a two box design with all the ancillaries

With the intended PCB you can incorporate all except the auto key, the PCB will be as small as possible (for cost reasons) so there would be plenty of room left for other "stuff" - it will be down to you to provide the charging circuit though.

Subject: [mkars80] CW adapter

Now with the capacitor mod we have quite reasonable VFO stability, I'm
considering designing a CW adapter; CW can be generated by simply injecting
an audio tone into the microphone socket, to avoid images and key clicks
this tone has to have controlled rise and fall times and also has to be
clean (low harmonic content).

Target specifications are as follows:
a.. Stand alone unit which plugs into microphone and speaker sockets of
MKARS80, microphone, speaker and key then plug into module.
b.. 12 power feed via DC socket
c.. CW band pass filter on receive as well as TX
d.. Switching from SSB to CW by push switch.
e.. Pre-set adjustments; CW tone frequency, hang delay, side-tone level.
f.. Side tone set to 700Hz, adjustable over a small range (possibly 600 -
800Hz)
g.. TX output level by potentiometer; easy to set - just adjust so
modulation LED goes out.
h.. Built in limiter for headphone use with a dedicated headphone socket
i.. Unit can also be used stand-alone as a practice oscillator - waveform is
nicely shaped so sounds good.
j.. Intention that unit is built into an extension speaker.
k.. Target price 15 - 20 GBP.
I'm looking for comments please.

Answer:

Key clicks
The need for offseting the BFO
Modifications to the PCB are necessary
Potential for instability

Otherwise its prefered as there is no chance of the carrier leaking or
harmonics of the audio oscilator causing "phantom" QSOs.

I had considered it before but didn't follow it up, I will take another
look.

Sounds good so here is my two penny's worth

> Target specifications are as follows:
> a.. Stand alone unit which plugs into microphone and speaker sockets of MKARS80, microphone, speaker and key then plug into module.

Please consider providing a separate ptt input on the module so allowing the microphone input on the module to be wired to accept a standard 3.5 mm stereo laptop / PC electret mike jack without the need for any modifications.
Similarly consider providing a 3.5 mm stereo socket so that standard laptop /PC stereo headphones (usually each of 32R impedance) can be used without modification to their jack so that:

Each channel could be wired in parallel thus providing a 16 R load to a conventional mono amp.
A stereo amp such as a TDA2822M with LPF and HPF channels could be employed with them as is to provide a "Stereo CW" effect or alternatively used in Mono Bridge Configuration to provide even more Watts.

> b.. 12 power feed via DC socket

Daisy chain to another DC socket to provide power to MKARS80

> c.. CW band pass filter on receive as well as TX

Separate LPF and HPF channels to simulate "Stereo CW" if cascaded could also provide Mono bandpass.

> d.. Switching from SSB to CW by push switch.

The apparent received Zero Beat CW frequency will differ from that shown on the MKARS80 display by an amount lower and equal to the frequency of the transmitted tone, it is perhaps too much to ask to arrange to also switch the PIC program to compensate for this.

However as long as persons are aware of this shift, in practice if the received reply is zero beat this should not be a problem as the received tone should agree with the transmitted tone and could be an advantage when tuned using a BPF and compared with a similar sidetone.

> e.. Pre-set adjustments; CW tone frequency, hang delay, side-tone level.
> f.. Side tone set to 700Hz, adjustable over a small range (possibly 600 - 800Hz)

Popular frequencies these, just as long as USB suppression is such that any images are well attenuated.

> g.. TX output level by potentiometer; easy to set - just adjust so modulation LED goes out.

Also helpful for SWR and antenna checks.

> h.. Built in limiter for headphone use with a dedicated headphone socket

Good, should help reduce damage to hearing also see earlier notes.

> i.. Unit can also be used stand-alone as a practice oscillator - waveform is nicely shaped so sounds good.

Could encourage more to try and send good CW.

> j.. Intention that unit is built into an extension speaker.

Maybe also providing space for PSU and Batteries

> k.. Target price 15 - 20 GBP.

About right for UK I guess. Should be bargain for Euro and Dollar customers and also please Mr. Brown!

> I'm looking for comments please.

You did ask so hope these are of help.

Thanks for the comments Charles,

In keeping with the philosophy of the original radio design I intend to keep it simple yet functional; there will be a stereo socket for headphones so ordinary PC types will plug straight in but to enable use of existing microphones I will have to keep the stereo socket with microphone on the tip and PTT on the ring. For my other radios I have made a simple adaptor with a PTT switch.

I don't intend to incorporate any stereo effects - just to keep it simple! Showing the frequency offset (and "CW" in place of "SSB") could be done if I made an internal unit, yet another possibility.

Regards,
Steve G6ALU

445. CW adapter

Yahoo group: mkars80
Date: 2008-12-23 21:44:02 UTC
From: Arnie Grubbs
Topic: 429 Message: 445

Hi Steve,The adapter sounds like a good deal, along with the built in limiter.. I assume that the limiter is so the lack of AGC doesn't bugger up someones ears, or the headphones?.. Being able to build it into a dedicated speaker enclosure sounds cool..I would be very interested in the adapter then!P.S. I had 3 of the MKARS-80 kits, but sold one to Darwin at one of our home brewers QRP meetings.. so I only have 2, both of which still need to be built. I have 3 weeks off for Xmas so maybe one will get started! (after I finish the 2nd RX install in my K3!)73 - Arnie KA0NCR - Also in Nebraska-=-=-=

David,

No attachment, did you intend there to be?

The one I'm building is loosely based on a design by PA0NHC. I will have a schematic available for scrutiny later.

>
>

Hello Steve (and all),

I'll buy two CW adapters once they're available.

BTW, I 've built a simple two-transistor AGC for the original MKARS80, just to protect my ears when I'm using my headset with boom mike.
Unlike other designs I've seen in this country, my circuit reduces the gain of the first RF stage, thus preventing RF overload and the resulting AF distortion. There is no need to modify the orriginal board, it's a simple addition. I can mail you the schemtic if you're interested.

Wish you and all members Merry Xmas and Happy 2009, may MKARS80 rule the waves!

73

Iambic keying circuit option - not everyone has a great fist.
For example...
http://homepage.eircom.net/%7Eei9gq/iambic.html

David,

No attachment, did you intend there to be?

The one I'm building is loosely based on a design by PA0NHC. I will have a

schematic available for scrutiny later.

Steve.

I've uploaded the cct of the tunable audio notch/peak filter that I've installed in my rig.
I lifted the -ve end of C39 and inserted filter there.
It could go outboard if you include an audio amp after it.

461. MKARS80 VFO Drift Modification Feedback

Yahoo group: mkars80
Date: 2008-12-24 22:31:27 UTC
From: g3oth
Topic: 461 Message: 461

I received a pair of 1000pF NPO Ceramic Capacitors from Steve yesterday as replacements for the Mylar types previously used for C59 & C60 in earlier kit versions. They came with full instructions and recommendations for removal of the old and fitting of the new capacitors.
It took me about half an hour tonight from start to finish to fit them and I can confirm that thermal stabilty at least on receive appears excellent.
In the first half hour from switch-on I only needed to adjust the fine tune control 3 times by only a few degrees clockwise each time, to compensate for an interval of left hand cursor drift and so keep the cursor centred. Three hours have now elapsed and the VFO has stabilised and the display is rock steady and the cursor is still in its central position.
I have done these tests with 12 volts from a wallwort applied to the PCB. It is in it's aluminium case on an open table in the living room where the temperature is fairly steady at 21 C and I have handled it several times during this period and not shielded it from draughts or lagged it in any way.
In the short time I have been using my MKARS80, although good, I don't think I ever acheived this level of stability using the Mylars, so would recommend this substitution to all concerned.
Merry Christmas
Charles G3OTH

Hello Steve,

I changed the two caps in the VFO (which I got from you) switched it on and did a quick (1min) re-tune of C38 and left it switched on and zero drift over a two hour period on receive. It remained on all afternoon and still no drift, I then had long QSO's this evening, some overs five to ten minutes long, and still it remained within the Huff & Puff envelope so needless to say I'm delighted with the improvement to stability. Many thanks. Two more sets to modify and hopefully with the same results.

I now look forward to the CW add-on and will maybe also think about the AGC mod.

Hello Steve,

The NP0 ceramic capacitors as a replacement for the Mylar types
appear to do a good job indeed. I still use polystyrene for two of
my MKARS80's but would like to try the caps you have now available
for all three I bought. Could you send me six of these caps after Xmas?

Thanks and 73

Thanks for the feedback Tony,

I had similar results on one of my radios (built recently from a kit) the other (1st prototype) was significantly improved - drifted during warm-up but didn't during long overs.

As all the ceramic capacitors are now NP0 types they can have a small positive or negative temperature coefficient so its just your luck whether they cancel each other out (and that of the inductor and Polyvaricon), in any case the radio is much more pleasurable to use.

I now have a layout for the CW adapter, I'm wondering if its too complex though - it has three potentiometers; CW drive level, hang time and side-tone level. Tone frequency is pre-set.

There are five PCB mounted connectors; DC power, Microphone / PTT, Key, Headphone and Loudspeaker. Included are solder pads for wandering leads going to the MKARS80 which are; DC power, Microphone / PTT and loudspeaker. Power can be daisy chained from the CW adapter to the MKARS80, this though may cause audio frequency instability due to ground loops - I need to check this with a prototype.

I will post a picture once its all tracked.

Seasons greetings,
Steve G6ALU

Hello Ron,

Our tests have shown there is little difference between polystyrene and ceramic NP0 types - I will send you replacements when the post office re-opens after Christmas.

Regards,
Steve G6ALU

Interesting. I think different sets will react differently due to slight component coefficient differences throughout the set. I secured all my toroids and transformers with clear nail varnish which might help.

Agreed, it's the icing on the cake :-).
>

It sounds fine to me and all necessary controls.

This is possible of course and will be interested in your findings.
>

Great. I will add a keyer chip to mine to use in Iambic mode.

Hello! Steve and the group:

I am thinking that the CW adapter might be of some in interest to people who have built BiTX20 or BiTX17 rigs.
I know that these rigs are probably not as stable as the MKARS80 with the H&P VFO, but some of the guys have
added DDS VFO's or other 'nifty ideas' to get the rig to stay put.

I don't know if you would want to put it out on the 'other' yahoo e-group, but I think you might find some interest there for your new kit.

If you don't want to go to the bother of supporting it in the USA, I would bet that Doug Hendricks of QRPkits.com would work with you to give you an outlet in the USA..

Anyhow, this is just a few of my thoughts.. hope I don't step on any toes by suggesting this!

Hello Peter,

I'm confused as well! Do you have access to a frequency counter? If so measure the frequency at TP 10MHz and TP VFO. It may be the VFO is running much too high in frequency; does the frequency change with tuning?

Do you hear any 80M stations? You should hear plenty in the evening.

Let me know how you get on....

Peter, I think you mean the BFO (measured at TP 10MHz)... if you are hearing things there can't be much wrong.

What frequency are you getting at TP VFO? If the VFO signal isn't getting to the micro you get a corrupt reading, something like "@.000400MHz" .

Check voltages around the buffer transistor Q8, hopefully this will lead to
the fault.

Regards,
Steve G6ALU

From: Steve Drury
Topic: 471 Message: 478

Are you sure you are receiving 80M transmissions? the fact that you can't get a reading at TP VFO is significant, the signal level here should be sufficient for most frequency counters. Have you checked voltages around Q11 and Q12?

From: m1dgq1@rocketmail.com
Topic: 471 Message: 479

what should i be seeing at vfo tp and q12 readings are a little low
gate is about 1.92 drain is about 2.5 and source is about 7.75

supply voltage is about 12.5 volts for refrence.

last minute test of vfo tp reading 67 mhzish

stopping for the evening will get back to it in the new year as away
from tomorrow

480. Update - CW adapter and new firmware

Yahoo group: mkars80
Date: 2008-12-31 13:44:09 UTC
From: Steve Drury
Topic: 480 Message: 480

A prototype of the CW adapter is being tested by John M0TIF who has identified a few minor issues but is otherwise pleased with its performance, I will modify the schematic and build a new prototype PCB before ordering quantity for sale.

To get the best out of the radio in CW mode I have made changes to the PIC firmware which is now at version 2.0, anyone who can program the PIC16F818 is welcome to give it a try and give me feedback on its performance. One requirement is that the VFO stability modification has been completed.

Firmware differences:
V1.1 - Huff and Puff output is driven by a PWM waveform, the problem with this is it has a limited resolution - each step (it is 10 bit - 1024 steps) changes the frequency by a finite amount; when listening to a constant tone (CW!) you can hear the frequency change, this is exaggerated by the Huff and Puff having a resolution of 25Hz. This frequency change meant the radio couldn't be used very effectively on digi modes - PSK31 for example. The tuning "bar" displays how much correction is being applied to the VFO so its possible to judge when lock will be lost.

V2.0 - When the VFO is tuned to the correct frequency the control output goes high impedance, when it is off frequency the micro generates short +Ve or -Ve going pulses depending on the correction needed, these are filtered by the existing resistor / capacitor filter. The frequency still wanders but slowly and not noticeably, this is also improved by the resolution now being 5Hz. The tuning "bar" now displays frequency error; actual frequency compared with displayed frequency. In normal use the bar will be central, if the Huff and Puff is about to lose lock the bar will move from the centre to the left or right depending on the direction of drift.

These firmware changes also make tuning more pleasant as the Huff and Puff won't fight you. Once the new release has been proven I will offer it as an upgrade for existing owners and include it in new kits.

The software can be downloaded from the group files section.

Regards,
Steve G6ALU

Good work Steve,
Looking forward to the CW adaptor, and will be looking for a spare PIC to program.
Any space left on the PIC for band-edge warnings?

Regards
Tony
G6XMO

Plenty of room, can I let someone else add them once the firmware is proven?

Good work Steve,
Looking forward to the CW adaptor, and will be looking for a spare PIC to program.
Any space left on the PIC for band-edge warnings?

Regards
Tony
G6XMO

A prototype of the CW adapter is being tested by John M0TIF who has identified a few minor issues but is otherwise pleased with its performance, I will modify the schematic and build a new prototype PCB before ordering quantity for sale.

To get the best out of the radio in CW mode I have made changes to the PIC firmware which is now at version 2.0, anyone who can program the PIC16F818 is welcome to give it a try and give me feedback on its performance. One requirement is that the VFO stability modification has been completed.

Firmware differences:
V1.1 - Huff and Puff output is driven by a PWM waveform, the problem with this is it has a limited resolution - each step (it is 10 bit - 1024 steps) changes the frequency by a finite amount; when listening to a constant tone (CW!) you can hear the frequency change, this is exaggerated by the Huff and Puff having a resolution of 25Hz. This frequency change meant the radio couldn't be used very effectively on digi modes - PSK31 for example. The tuning "bar" displays how much correction is being applied to the VFO so its possible to judge when lock will be lost.

V2.0 - When the VFO is tuned to the correct frequency the control output goes high impedance, when it is off frequency the micro generates short +Ve or -Ve going pulses depending on the correction needed, these are filtered by the existing resistor / capacitor filter. The frequency still wanders but slowly and not noticeably, this is also improved by the resolution now being 5Hz. The tuning "bar" now displays frequency error; actual frequency compared with displayed frequency. In normal use the bar will be central, if the Huff and Puff is about to lose lock the bar will move from the centre to the left or right depending on the direction of drift.

These firmware changes also make tuning more pleasant as the Huff and Puff won't fight you. Once the new release has been proven I will offer it as an upgrade for existing owners and include it in new kits.

The software can be downloaded from the group files section.

Regards,
Steve G6ALU

Hello Steve,

Good news that the CW adapter is nearing completion.

I have just got a PIC programmer but not used to using it yet, what files would I have to load into the PIC? Would it just be the HEX file or all of them?

If all else fails I'll wait for the V2 PIC to be available.

Thanks again for a great rig and all your hard work, much appreciated.

Hi Tony, what programmer is it? For most you can just load the .HEX file.

OK, sorry I can't help with that programmer but it should be straight forward, all the fuse settings (watchdog timer, oscillator type etc) are contained within the code.

Thanks Steve, would I clear the chip first and then load on the HEX
file? Sorry for the dumb questions, this programming is new to me.

I also have a Velleman K8048 programmer someone gave to me.

Morning Tony,

Most programmers will erase automatically first. Winpic will run the
Velleman programmer if you are stuck for software.

Regards,
Steve G6ALU

Good morning Steve hope you enjoyed the festivities.

I plucked up courage and read the PIC and saved the file and then
erased the PIC and wrote on the new V2.0 HEX file and it worked :-).

First impressions are good, I particularly like the "U" whilst tuning
and then returning to the usual bars when the Huff & Puff takes over
and the 5Hz resolution is also much better for tuning. The Huff &
Puff still seems to switch in to early like V1.1, or am I too slow :-).

I will have a play this afternoon and evening and report back.

Thanks again.

Tony,
Be even braver and load MPLAB then you can edit the code, the line you want
to alter is:

HoldDelay equ .40 ; Delay after, frequency change - Approx
8 seconds

The value 40 is decimal, 40 x 200mS = 8 seconds

Have fun,
Steve G6ALU

Cheers Steve I will download it when I pop round to one of my friends who have broadband, we are on painfully slow dial-up here being right out in the rural countryside. The plus side is very little noise on the bands :-).

Interestingly the delay on the Huff & Puff is approx eight seconds when the set is initially switched on but appears to come in a lot quicker when one is actually tuning around, this was the same as V1.1. I will have another check on it in the morning to make sure I'm not going completely mad :-). Also I will check to see if the software for the programmer I have here allows one to edit the code that way I can experiment with the timing.

Thanks again.

Tony,
I have uploaded version 2.1 of the firmware to the server.

Ray G4TZR suggested a change to the algorithm; instead of waiting the 8 seconds after EVERY loss of lock the new firmware waits 3 seconds but if in that time the frequency has changed by more than ?15 Hz the timer is reset. This seems to work very naturally now and tuning is easy and pleasant.

Please give it a go and let me know what you think, if there are no issues this is the version I will go with.

Regards,
Steve G6ALU

NOTE
To keep to the spirit of our license "for the purpose of self training in radio communications" I provide the source code so that anyone interested can change and fine tune the firmware to their own taste and learn in the process.

Hello Steve,

Thanks for the new firmware. The tuning is
certainly more pleasant and natural, a great improvement.

Just a very small finding - I still find it a bit
tricky to get it to stop exactly on the frequency
I want ie 3.682000, even using the fine tuning (I
also have the 10:1 reduction drive), it seems to
jump +or - 10-15Hz either side then locks. This
is not really an issue as a few Hz either way is
not a problem and it could be my tuning of course :-).

73 Tony

>Tony,
>I have uploaded version 2.1 of the firmware to the server.
>
>Ray G4TZR suggested a change to the algorithm; instead of waiting the 8
>seconds after EVERY loss of lock the new firmware waits 3 seconds but if in
>that time the frequency has changed by more than ±15 Hz the timer is reset.
>This seems to work very naturally now and tuning is easy and pleasant.
>
>Please give it a go and let me know what you think, if there are no issues

From: Ray Stringfellow
Topic: 480 Message: 496

Hi Tony

I also have this "feature" (it would be unfair to call it a
problem).

I find it's down to me being heavy handed and applying axial pressure on the
tuning knob. Pressing on the case has the same effect.

When in safe cracker mode it's fine and as you say a few 10s of Hz are not
noticeable.

Ray

From: Steve Drury
Topic: 480 Message: 497

Good morning / evening,

I find it tunes OK and doesn't jump with a standard set-up, getting the last 5Hz is a lottery though but I don't have any way improving on that other than increasing the resolution without displaying it. This probably wouldn't work too well as the control pulses would be longer and become evident as modulation on the VFO.

By looking through the software you may have noticed it generates two different correction pulse lengths depending how far off frequency it is - as the fine tune pulse is very short (approx. 20uS) it can't overcome much leakage in the filter capacitor which was specified as an electrolytic for cost reasons! If the frequency error is greater than 25Hz a long pulse (approx. 250uS) is applied, even in this situation the Huff and Puff performance is better than version V1.1. This situation is only likely to happen if the radio has been turned off for long periods.

I left it on 3,733MHz (local digi SSTV) all evening and pulled off many pictures, also had several PSK31 contacts into Europe without problem.

Let me know if you find any other issues.....

Regards,
Steve G6ALU

Hello Ray,

I agree it's definitely not a problem just a "feature", as you aptly
put it, that needs a softer touch :-). Tuning around this afternoon
was fine and I think V2.1 of the firmware has made this rig a pleasure to use.

Incidentally, after tuning around this afternoon, the rig has been
left on receive for the last 8 hours with no drift at all and will be
left on overnight as a soak test.

Topic: 500 Message: 501

Hello Ian,

The kits cost ?45 including an un-drilled case, postage in the UK is ?3 and they are available from us!

There are two methods of paying, by cheque; please make a check Payable to Radio-Kits for ?48 and send to:

Radio-Kits
25 Crosslands,
Stantonbury,
Milton Keynes,
Bucks.
MK14 6AY

OR by Paypal, please note we pass on the Paypal commission charge of ?2. If you would like to pay this way please transfer ?50 to our Paypal account val@... .

For overseas readers prices in this mail are in GBP (the pound sign may be converted by email software) and postage is GBP 4 to Europe and GBP 6 for rest of the world.

Regards,
Steve G6ALU

Tony,

I've looked at the K8076 device list and it isn't there so doesn't
look likely.

In a previous email I gave a URL for the DL4YHF programmer -
unfortunately the QSL web is down but here is the mirror site:

http://freenet-homepage.de/dl4yhf/winpicpr.html

Hi Tony,
I'm not sure if this helps but I bought a programmer from a guy in China via Ebay last November and the service was good as was the unit. I just checked and they are still available at the same price.

It's connected via a USB port so there is no need for any external supply although one can be connected if the port cannot supply more than 200Ma. It has a 40 ZIF socket so it can handle quite a lot of devices.The software is quite reasonable too.

If you would like any other info please let me know.

It works out at about 38 Euro.
73,
John.

From: tedg4ozg
Topic: 505 Message: 505

I built my MKARS 80 in Aug/Sept having done almost no construction for years and it worked first time, a tribute to Steve G6ALU, it was almost painting with numbers and you couldn't really go wrong. Steve had a look when he came to the Kings Lynn Club in September and pronounced it fit. It has rekindled my enthusiasm and gets used much more than the IC706. I have worked GM,GD,GW,EI,F,DF,PA,SN,OZ,ON and a lot of G's and M's, several other MKARS 80 users mostly on the 2 nets we had but also some local to me and also Brian G8DIU who called me out of the blue.I have also been portable twice with a fishing pole vertical and had good reports. Its a bit of a struggle sometimes but surprisingly a lot of stations do hear me.
After chasing the frequency a lot for 3 months,yesterday I fitted the NPO caps that Steve sent me and this morning switched on at 7.15 and after an hour it had drifted high by just 2kHz. I then used it on a net for another hour and only had to adjust the frequency once, but the overs were quite short, a big improvement. One station in Southampton recorded me and played it back commenting that the audio was very good!
My QTH is Kings Lynn, Norfolk and the antenna is a 80/40 trap dipole at 5 metres.
If anyone can't make up their minds about building the MKARS 80,just do it, if I can, you can, and have some fun.
All the best, Ted G4OZG

Thanks for the glowing report Ted, you will find the new firmware gives
further improvement being much "nicer" to tune.

I'm holding off releasing programmed chips though until we have a few hours
of testing with different radios and operators - this software is a big
change from the existing release.

Regards,
Steve G6ALU

Topic: 480 Message: 507

Further update on the CW adapter...

It was suggested (by Ray G4TZR again!) that I might include a keyer (Iambic keyer for dot and dash paddles) in the CW adapter circuit, to me a keyer is not really necessary so I didn't want to increase the kit cost by incorporating one. However having laid out the PCB I realise there is some wasted space in the corner so I have a plan......

I intend to incorporate the PCB for an Iambic A and B memory keyer designed by DL4YHF (see http://freenet-homepage.de/dl4yhf/pic_key.html), components for this would be a COST option so the if you don't want it you don't pay for it! The keyer will be snipped out of the PCB and used as a stand-alone module, I will leave it up to the constructor to decide how and what it is used for - it will be compatible with the CW adapter though.

Hello Steve,

An excellent idea to have the Iambic keyer as an option. Another
place to look is <mailto:k1elsys@...>k1elsys@... , for the
K12 and it uses less components. Not sure what the cost difference
would be though.

It looks to be very sophisticated but is too expensive at $10 landed.

Understood Steve, it was only a thought :-). The DL4YHF keyer looks
just as good and it does use PIC chips which can be reprogrammed of course.

Steve

I am embarrassed to say I bought your mkars80 and have not yet started to build it. It was a while ago!

I've been seeing some mods and firmware changes on the reflector. I would like to find out what my kit doesn't have and buy updated parts before I start to build it.

Thanks in advance

rOn Pfeiffer

Hi Ron,

Two changes have been made; a change of two capacitors (C59 & C60) in the VFO from Mylar types to 1nF NP0 ceramic, this mod improves temperature stability. I have recently improved the firmware but this isn't an escencial change.

I will announce on the group shortly how I intend to handle upgrades, I will though include the capacitors for anyone wanting the micro upgrade.

Regards,
Steve G6ALU

Hi Steve,

Have you plans to attend any rallies this year with a stand like Donnington?

My copy of Practical Wireless arrived this morning, I look forward to the review next month [:D]

Happy New Year,

73,

John

Hello Steve and all,

Since the firmware is under review at present, I wonder if it would be possible to make a slight cosmetic modification to it. I would very much like another decimal point in the frequency display.
Presently, the display shows only one, to separate the MHz from the kHz. I would like to see one between kHz and Hz. For instance 3.755.200 instead of 3.755200.
I know that the subject line of the LCD has only 16 characters, but the indication "LSB" could be left out, or "MHz", because this is not vital information.
Personally, I find a display with all decimal points easier to read. and I know from some of my fellow hams that they feel the same.
It's only a minor point, I do realise that. Could it be incorporated in a new firmware release?

I still enjoy my MKARS80's very much, and plan to build my third one very soon now. I'll stick to varactor tuning, by the way. In my second MKARS80 I've incorporated my version of Jim's (VE3XJ) circuit whereby the 80m band is split up into three 100 kHz segments that can be switch selected. In that way, the 10-turn pot virtually becomes a 30-turn pot. This makes tuning even more pleasant. I don't need the fine tuning knob any longer and have used the front panel position for a band switch. I sure do look forward to the new firmware release as tuning than becomes even easier.

Enjoy the hobby, thanks and 73

Ron pa0rcl

> I know that the subject line of the LCD has only 16 characters, but the indication "LSB" could be left out, or "MHz", because this is not vital information.
> Personally, I find a display with all decimal points easier to read. and I know from some of my fellow hams that they feel the same.
> It's only a minor point, I do realise that. Could it be incorporated in a new firmware release?
>

Hello Ron
I tend to agree with you but why not go for 3755.200 instead.
That way only the position of the decimal point is changed and as only one is needed, LSB can still be retained and MHz changed to KHz.
I know that Steve mentioned sometime earlier he might want to display either LSB or CW to indicate modes, so what do you say Steve ?

Steve, I have been tempted several times to purchase the K8048
Velleman PIC programming kit from Maplins, which I note supports the
PIC16F818 you use for trhe MKARS80.
I have never been involved with PIC programming before, but I am
trying to read through Cliff (G8CQZ) Powlesland's book PIC Basics
(RSGB) to find out what is involved.
It would appear that this Velleman kit apart from a PIC has
everything necessary (hardware, compiler and loader).
Looking at the files section in this forum I see you have recently
put up two zipped up files.
One dated December 2008, another January 2009.
I see from memory the earlier one contains 4 files with .asm, .HEX,
inc (x2) extensions
The later one has 5 files .url, .mcw, .HEX, .asm, .inc
I looked at these with notepad and saw in the HEX files something
that I recognise as probably being the file needed for programming
the PIC, but what are the other files used for or are they in an
assembler language, or text prompts, as to what is going on ?
It is all Double Dutch to me (sorry Ron) but can you please lucidate ?
What programmer do you use and for the record what program language
C, C++ or other files are needed.
Sometime I am going to have to face all this if I am ever to get my
Star started.

Charles,

I advise the use of Microchip's own development environment MPLAB
which can be obtained free of charge for www.microchip.com but you will
need broadband to download it.

.asm files are the source (text files)
.hex is the code ready to be programmed
.inc are assembler files to be included in the main assembler file

Other files are generated by MPLAB.

Regards,
Steve G6ALU

Nice to hear Ted's fine experiences with the MKARS really do agree with all his comments on this great little transceiver it is indeed a fine tribute to Steve G6ALU in all aspects. I have worked pretty much the same areas as Ted plus a few RA, PA, OH and HA.

Recently having the chance to try Steve's CW adaptor with narrow filter It worked very well indeed and its a very exciting prospect, once the final version is available, that the MKARS80 will have CW mode.

From: pa0rcl
Topic: 520 Message: 520

Hello Charles,

As I remarked the extra decimal point is only a minor issue. Unlike you Britains, continental Europeans have become used to the decimal system for ages. Even all my Japanese rigs display 3755200 as 3.755.200. This is the only correct way. For my sake, the characters "MHz" on the MKARS80's display could be left out and an extra deceimal point added if the first three positions should remain to display the mode.
I will probably have do dive into PIC-programming (it's Double Dutch to me also, no offense taken, the French even say that Dutch is not a language but a throat disease) myself to implement this desire. But as I wrote to Steve I'm from the tube era and I'm not sure if I'll ever manage to master PICs. However, I intend to order a Velleman PIC-programmer and I've already downloaded MPLAB as indicated by Steve. So far so good!
BTW, my remark should not be seen as criticism. I'm very satisfied with my MKARS80's and Steve has surely done a wonderful job, I concur with all other posts on this. In addition, Steve's support is admirable, not to mention his patience!

Thanks Steve
I have since downloaded MPLAB IDE v8.10 successfully and installed it on my PC.
I was able to view your .asm, .hex, .inc files with it, but don't suppose I can do much more until I get some hardware, you didn't say anything about what you thought about the Maplin kit, it's available for about £21 according to the catalogue I have here.
Meanwhile I will try to fathom out what all the instructions are about, that should keep me busy for quite a while Hi Hi.

I must admit I hadn't noticed whether my ancient Yaesu digital rigs displayed the two decimal points or not. I know they display the decimal point before the 100 Hz digit, but guess you are right because I seem to remember the MHz and KHZ digits are separated somehow. I must take note next time I switch them on.
If I had to choose what to do with one digit I would however always go for it to be placed before the 100 Hz digits however, at least for frequencies up to 9999KHz. Subconsciously I think I have been struggling a little when looking at and reading the dial on my MKARS80 and now since you mentioned it in your message I thought it maybe now was a good time to bring it to Steve's attention and also get the views of others as well.
Like you I started in the valve era and my eyesight is not too good now, my first computer experience was using punched cards and ticker tape and teleprinters to load in Ferranti Pegasus autocode and MAC in the 1950s long before Mackintosh got that nickname.
As you can see from the above I have also loaded in MPLAB now but I think you will probably beat me into getting a PIC to work.

Charles,

I don't have much experiance with the Velleman programmer but I see that Winpic will work with it if required. Try loading the latter of the files I posted into MPLAB as a project and with a bit of luck it will work!

I'm inclined to agree that an additional decimal point will enhance the readability, I plan on leaving the code as is for a while but will perhaps load a modified version to the group as an option at a later date. Once you've got a programmer though you might like to have a try at changing it yourself.

If you look at line 493 onwards of the latest code you find the frequency display routine, this and the text strings are all you will need to change.

OK, just for you Ron I've modified the code and uploaded it to the file section, as an eample the top line now says:

LSB 3.727.500 Hz

How's that?

That's just fine Steve, thanks very much. The only thing I still need to do now is get acquainted with PIC programming.....

OK, just for you Ron I've modified the code and uploaded it to the file section, as an eample the top line now says:

LSB 3.727.500 Hz

How's that?

Hello Steve,

I've also loaded the new firmware and it looks perfect, just how it
should be :-), thanks.

I now have to play with MPLAB and get my call sign in the welcome
screen, I've spotted the "Your call sign here" line.

33.5C here and wall to wall blue sky.

Tony,

Easiest is to replace the "www.mkars.org.uk" bit.

Steve

Thanks Steve will give it a go.

Have just replaced the caps in a friends rig and updated the firmware
and he was highly impressed.

Dom, I am glad you asked this question as I have held back doing
anything about mechanically securing the coils and transformers on my
pcb until I could decide what best method to use.
In my opinion this job really needs to be done as they are too
vunerable to be left floating, touch wood, so far I have been lucky
that I haven't broken any wires going to them when handling the PCB
whilst fitting in case, replacing the vfo caps and making adjustments
etc.

I dont know what Steve's official recommendation is but as far as I
am concerned there are several possibilities I have considered so far:

1 Use Beeswax. Probably good enough for job, easily melted and
reworked, shouldn't effect L or Q too much.

2 Use Superglue. Possibly too good, not easily removed, probably does
not effect L or Q.

3 Use 2 part epoxy. Ditto as 2 above but even more difficult to
remove
and probably would make toroids and binoculars not reusable, don't
know
what effect this has on L or Q.

4 Use Hot Melt Glue. This has been used a lot apparently by BITX20A
users particularly in the USA, but I have not used it in this context
myself however I have a gun etc. and use it elsewhere for other jobs.
My feeling is it might work but may suffer from the drawbacks I have
postulated above in 3.

There maybe other methods that I have not considered, so I would be
interested to know what other members of this group have used and
whether they would still use their method again if they were to face
having to rework their kit.

BTW it is wonderful experience to see the display on the LCD remain rock steady and the SSB audio output unchanged whilst I gently "fiddle" with the unsecured VFO coil. That never happened for me before I used the H&P stabiliser technique!

Looking forward to hear all your findings before I take the plunge and "Stick down" my beasties.

73 de Charles G3OTH

PS Forgot to mention another method I have thought about:

5 Use a proprietory (Rustins) Wax / Shellac Woodfiller stick used in
furniture restoration available from DIY stores. This easily melts
and remelts using a soldering iron (although higher than MP of
Beeswax), sets harder than Beeswax and is thus not as sticky and
hence does not attract as much dust, fluff and lint with age, which
can be a draw back with using 1.

I can't think of any more Hi Hi.

Ray, I also use this all the time for various jobs whilst assembling PCBs and agree it also works for toroids etc. and is very handy (apart from a tendency for picking up wire clippings and solder droppings whilst doing so, which you should look out for).
I would however prefer a more permanent and better looking cosmetic solution if there is one.

I would go for a small amount of silicone sealer, not the type which smells of vinegar of course!

73,

John.

All version V1.3 onward are going out with the new VFO caps and version 2.1
of the firmware - I have been sending these out for a week now.

Yes I usde Dow corning 3145 but it costs the earth and comes in a BIG tube, mine was purchased at arally for ?1 though!

I have seen small tubes of a silicon adhesive in craft shops used for card making etc. I understand these are acid free.

Perhaps a small blob of wax or hot melt would be the best option otherwise.

543. Velleman k8076 and Pic16F818 solution

Yahoo group: mkars80
Date: 2009-01-08 15:47:56 UTC
From: pa0ppw
Topic: 543 Message: 543

As quite some Mkars80 enthousiasts, I wanted the latest software in the
Pic16F818. A Velleman k8076 progger is not suited to prog a Pic16F818
as the software supplied does not mention that Pic.
The following solution is found.
Download the freeware programmer software Winpic800.
Under hardware choose JDM progger and choose as Pic the 16F818.
Connect the k8076 as usual and tie the wiring as a 16F84A.
With the 16F818 in the k8076, erasing and programming went fine.
I am open for questions.
Pierre (PA0PPW)

Hello Ron,

Your AGC mod looks very good, did you design a PCB layout or just used
a small bit of Vero board? Also how did you set up the two pots, it
may be obvious when built of course but I thought I would ask in case
others would also like to adopt your fine design.

Many thanks.

Hello Tony,

My circuit was built Manhattan style, I plan to make a simple Vero board to carry all of my home-brew additions, including prescaling trimmer pots for the varactor tuning.
The two AGC trimmer pots can be on the board and the setting of the left hand one is indicated on the schematic.
The setting of the right hand pot depends on your own liking and whether or not you use earphones. You can still use the RF gain control as usual. Experiment!
BTW, my design was inspired by the Taurus transceiver by SP5DDJ that I have here waiting to be built; we all borrow ideas from each other!

Good luck and enjoy the hobby,

73

From: peezetje
Topic: 546 Message: 546

Hello Steve,

With the help of Pierre PA0PPW we put the new firmware (2.1) into the PIC controler. Works great, much smoother tuning specially in CW mode. HOWEVER display seems to be off frequency al bit. 3.600.000 MHz on the display is 3.599.900 in real, so a difference of 100 Hz. Can this be solved somewere in the software?

73, Tont PA0PZ

Yes it can be adjusted in the software but the reason it has probably changed is I measured the centre frequency of my filter and corrected the BFO frequency, you can correct this 100Hz by simply adjusting the BFO (10MHz) oscilator slightly.

553. MKARS Pic programming offer

Yahoo group: mkars80
Date: 2009-01-09 22:14:29 UTC
From: John
Topic: 553 Message: 553

Hello all,

Just dusted off my old Vellaman interface and can confirm I have successfully updated my MKARS80 software using WinPic.

It occurred to me not anyone has access to programme facilities or has the inclination to reprogramme the MKARS80 pic themselves, in which case I am happy to programme it for you with the latest software.

You have the option of personalising with your call sign appearing on the display at switch on also the frequency displayed as 3.700000 or 3.700.000

You would need to remove your old pic from its socket and send it to me. I will despatch it back to you with the latest software usually in 24hrs of receipt for the following cost...

UK 2.50GPB including return postage and packing
Oversea 4.00 including return post and packing

Payment by cheque (UK bank only) or PayPal (sorry you pay the PP charge in addition to above)

Anyone interested simply contact me direct by e-mail m0tif@...
please put anything radio related in your e-mail subject header ie mkars80 pic.

73 John (M0TIF)
Member of MKARS

555. It Works :-)

Yahoo group: mkars80

From: darren_parvin
Topic: 555 Message: 555

Not that I had any doubt, but my newly finished MKARS80 receives OK.

I need to sort out the case, a mic and calibrate the BFO but so far so good.

Next step is to get a PIC interface and update the firmware. I understand from earlier posts that the MPLAB software is the way to go but I'm still a little confused as to what programmer hardware is best.

It's been a fun project and has certainly encouraged me to start constructing again.

Darren 2E0DJP

556. Re: [mkars80] It Works :-)

Yahoo group: mkars80

From: Steve Drury
Topic: 555 Message: 556

Pleased to hear its working Darren, if you want to update the firmware yourself try downloading Winpic and in the help file you will find examples of simple programmers. If you would like someone else to re-program your micro see the earlier post from John M0TIF.

Regards,
Steve G6ALU

PS The radio works perfectly OK with the earlier software (V1.1) just that later versions are a little more refined.

Thanks for offering the service John.

To use the new firmware its important to also do the VFO capacitor mod. To help out I will give you a quantity of 1nF NP0 ceramic capacitors so you can supply two with each re-programmed micro.

Note all kits version V1.3 (or later) will include the VFO mod and new firmware, I have been sending these out for a week or so.

Regards,
Steve G6ALU

558. Velleman K8048 kit now supports PIC16F818

Yahoo group: mkars80
Date: 2009-01-10 12:18:29 UTC
From: John
Topic: 558 Message: 558

Hello All,

For those of you with the K8048 Vellerman have a new release of
software V2.6.0 for the K8048 interface which supports PIC16F818 as
used in the MKARS80, also many more pics.

It can be downloaded free from:
www.vellemanprojects.com/be/en/download/files/

The pic type appears in the drop down box now but I have not actually
tried programming as I now use WinPic successfully.

Yes I'm pleased with it Tony, the keyer also works well.

Unless anything unexpected happens (with the pound) the adapter will cost
GBP 20 and if components for the keyer are wanted they will be GBP 5 extra.
The keyer PCB is part of the main PCB board which allows constructors to
source their own components if they wish.

Hello Steve,

That's good news, I would definitely be interested in two, including
the keyer parts, please. When they are ready for shipping can you let
me know the total cost then I can send funds via PayPal.

Thanks for all your hard work.

It's hot here around the mid to upper 30's forcing one into the shack :-).

566. Velleman K8048 kit via USB/RS232 converter

Yahoo group: mkars80
Date: 2009-01-25 20:58:48 UTC
From: darren_parvin
Topic: 558 Message: 566

The updated firmware files seemed like a great excuse to try out a PIC interface and I have built one from the kit.

However, not having any RS232 ports on either of the computers I'm trying to use a USB/RS232 interface but with no joy.

The drivers for the interface have installed OK but I'm getting conflicting reports on whether the K8048 will run with a USB adapter, so has anyone run the K8048 via USB?

Just to make it even more of a challenge, I have a choice of either Vista on a PC or WinXP via a virtual machine on a mac laptop.

So facing what seemed like a simple thing, I'm now totally confused as to which way to direct my efforts. I've the firmware loaded into MPLAB's IDE, modified the welcome message but failing miserably trying to write to the PIC.

Hello Darren,

I can confirm the K8048 works directly connected to a serial port, I have just tried mine using a USB to serial adaptor and cant get it to work either under XP. Thats not to say its impossible, my PC is rather old and while I have managed to get other bits of hardware running using the adaptor most don't. Hopefully someone will come up with a solution for you on here.

I half remember something in the kit documentation that says it will not work with a USB-Serial adaptor.

Steve,

Fantastic. I will be asking for two adapters and keyer parts when available.

73 from Oceania,

Jerry N4EO/KH6

Of Steve Drury
Sent: Saturday, January 24, 2009 11:27 AM
Subject: Re: [mkars80] CW adapter demo

Yes I'm pleased with it Tony, the keyer also works well.

Unless anything unexpected happens (with the pound) the adapter will cost
GBP 20 and if components for the keyer are wanted they will be GBP 5 extra.
The keyer PCB is part of the main PCB board which allows constructors to
source their own components if they wish.

Thanks guys.

I must admit I checked out the velleman site before getting the kit, don't know how I missed the warning !

OK, now to hunt for a serial port card for my PC.

573. [mkars80] firmware

Yahoo group: mkars80
Date: 2009-01-26 19:18:46 UTC
From: pa0rcl
Topic: 573 Message: 573

Hello Steve,

Here I am again with a minor issue about the firmware.... It sure is a minor one and I barely dare to bring it up! However:
The center Huff & Puff indicator is a horizontal dash, and the other 3 right and left, if they are displayed, are all the same dashes. If one has two dashes displayed, it is somewhat hard to tell in which direction one should turn the tuning knob in order to correct the frequency drift and display one (center) dash again. I sometimes turn the wrong way. This slight problem can be overcome easily by making the center indicator different from the other ones. If, for instance, the center dash would be a + (plus) or a vertical dash, or any other convenient character, it is easier to bring the the H&P circuit back to the center with the fine tuning, as one does not have to find out first which of the two or three displayed dashes is the center one.
It's only an idea ....

Thanks for your consideration and 73,

Ron pa0rcl

Hello Steve,

Ron makes a valid point here, we might as well make it as pretty as we can :-), would it be Line 636 in the program ie (movlw "-" ; Centre bar). I think a change to a vertical bar would look best ie (movlw "|" ; Centre bar).

What a fussy lot of hams we are :-).

Sorry for the slow response but I have been giving it some thought.

The "|" or a "+" sounds a good idea and is easy to implement but I'm trying to avoid many different versions of the code floating around. There will be another release soon so please let me have ALL the ideas so I can incorporate them!

I encourage everyone that is interested in making changes to get a simple programmer and have a go themselves.

Hello Steve,

Your policy to restrict the number of firmware versions is perfectly understandable and appreciated. However, I knew you had to change the code anyway, so this is why I took the liberty to suggest the mod. Indeed it is my firm intention to dive into PIC programming myself. That does not mean that I plan to change or even write code myself. I will see how far I get!

In view of your incitement to come up with ideas, here is a comment about the most recent firmware mod, i.e. the improved H&P routine. Judge for yourself if it is an idea or not. Personally, I have trouble tuning the last (most right-hand) digit. The H&P seems five times more accurate than before, it rounds to 5 Hz instead of 25. This has its consequence: if I want for instance 3.600.000 Hz, I usually end up with 3.600.005 or 3.629.995. I have already reduced the range of the fine tuning pot by adding a series resistor, but to no avail.
Quite frankly, I am not much interested in the last digit. Personally, I do not hear 10 Hz difference in the other party's voice pitch. Of course, I might as well simply disregard the last digit, but my mind wants to see zero's in the present case. I wish there were a way to blank the last digit, permanently for my sake. I did it temporarily by sticking a piece of paper on the last digit of the LCD, just to fool myself. As can be expected, it -virtually- makes tuning easier and more precise. All my other HF rigs, Kenwoods, do not display the Hz digit although they have precise and stable digital VFO's, there must be a reason for this. I never felt it was a problem that the Hz-digit was missing. I have no idea what the general feeling is about this, and this is why I post my comment here. This is not meant as criticism, I am still very pleased with my MKARS80s and I just started building my third one.

Thank you for your consideration and 73s

I have been trying a few variations of the tuning display and have settled here that the centre bar remains the same - but changed all negative bars (to the right of centre) to < and all positive bars (to left of centre) to > this also gives an indication which way to turn tuning knob to correct back to centre, effective and looks good.

Hello Steve,

If the "|" was used it may go to one side of character block in the
display and that would look odd but on the other hand it may centre
itself, not sure. Or keep the "-" in the centre and incorporate the
chevrons as John suggested.

Ron's suggestion of removing the Hz digit may be valid and that way
the M could be reintroduced and return the display to MHz.

The centre frequency could be indicated using the caret '^' character I suppose.

Hello Steve and all,

Restoring "MHz" instead of "Hz" if the Hz digit is sacrificed is fine
with me.
About the chevrons suggested as indiators for fine-tuning left or
right, maybe we should remember that the original MKARS80 tunes the
"wrong" way. People like me with varactor-tuned MKARS80's turn the
"right" way, i.e. frequency goes up if knob is turned CW.

73 and have a nice weekend

There is no restriction to what character is used for the central "on tune" indication as I can load whatever into the character generator ROM.

Are there any who think removing the last digit (Hz) will be a problem?

I probably shouldn't be allowed a "vote" because my kit isn't finished
yet but I would not be in favour of removing the last digit.

73,

John.

On second thoughts Steve I would be in favour of keeping the last
digit, no point in downgrading it's accuracy. I seem to be able to
get it spot on now. Just change the tuning characters that would be great.

Again thanks for all your hard work.

Steve, having noticed the feedback on the above issue today I ordered the Velleman PIC programmer as an attempt to keep abreast with technology and burn my own PICs in the future. I'll see how far I get.... Personally, I don't have second thoughts on the last frequency digit; perhaps I'll manage to solve the issue myself in the future. I can well live with the last digit for the time being and even with the horizontal bars. I've temporarily marked the middle horizontal bar on the display with a black felt tip pen, so it looks as if there is a + sign when the MKARS80 is on.
BTW I'm in the process of building a simple but very stable PLL VFO for the MKARS80. A fellow ham in this country has developed one and I'll give it a try. Probably this will make the H&P superfluous. I realise I'm drifting away from the original MKARS80 idea: simple, affordable and effective.

Hello Steve,

Just wanted to let you know that I've built the Velleman K8048 PIC-programmer today. I bought it as a kit since I like building kits. An hour after its completion I downloaded the PA0RCL 2.1 firmware version from the files section and burnt my first PIC! And it works!
I should have done all this much earlier, I must confess, it is easier than I thought it would be.
Burning a PIC is one thing, changing the code is quite another chapter. I'll dive into this also, who knows.
Meanwhile, I'm ready for whatever firmware update you may want to give us.

BTW, congratulations on the renewed success of the MKARS80, it is certainly well deserved for all your hard work! Many hams in this country have one and from what I hear many more are interested.

Thanks and 73,

Ron pa0rcl

John, my Velleman K8048 works fine with Progpic2, but I just cannot get it to work with Winpic. The interface definition file is OK, I think it is "velleman_k8048.ini" and if I initialize the programmer I get a report saying that it is OK. Any idea what I'm doing wrong? I've spent a few hours on this already ...

Thanks for your help,

Hello All,

For those of you with the K8048 Vellerman have a new release of software V2.6.0 for the K8048 interface which supports PIC16F818 as used in the MKARS80, also many more pics.

It can be downloaded free from:
www.vellemanprojects.com/be/en/download/files/

The pic type appears in the drop down box now but I have not actually tried programming as I now use WinPic successfully.

John (M0TIF)

Hello Ron,

Have you done the following?

In the interface tab change "interface type" to "Custom on LPT port defined by file" if its parallel or "Custom on COM port defined by file" if its serial. Use the select button underneath to select the Velleman .ini file.

Regards

John (M0TIF)

591. Firmware version V2.4

Yahoo group: mkars80
Date: 2009-02-02 20:34:49 UTC
From: Steve Drury
Topic: 591 Message: 591

I've uploaded the latest firmware to the group - this has a "+" sign as the central character but I haven't removed the least significant digit.

Any one with version 2.1 or 2.2 may note that there is a bug in the frequency read-out between 3.774.080 and 3.774.720, if you would like your micro replaced please email me direct. This will only affect those sold a radio last week of December / first week of January, I will be making separate arrangements for Telford club members.

Just fine, Steve, thanks very much, I'll try not to bother you any
more with firmware changes or PIC burning!

Many thanks Steve, have downloaded it and put my Name and call sign
in and it looks great.

Sorry to hear of the bad wx you guys are having over there.

Thanks again.

Hello John,

Indeed I had overlooked this option. It works fine now, thanks very much for your quick help!
I was able to make PICs with firmware version 4.2 now, my next aim is to change the source code as to include my call and then assemble it. No luck with MPLAB so far. Will keep trying.

Thanks again and 73's

Hello Ron,

Have you done the following?

In the interface tab change "interface type" to "Custom on LPT port defined by file" if its parallel or "Custom on COM port defined by file" if its serial. Use the select button underneath to select the Velleman .ini file.

Regards

John (M0TIF)

>
> John, my Velleman K8048 works fine with Progpic2, but I just cannot get it to work with Winpic. The interface definition file is OK, I think it is "velleman_k8048.ini" and if I initialize the programmer I get a report saying that it is OK. Any idea what I'm doing wrong? I've spent a few hours on this already ...

596. PIC-programming - HELP!

Yahoo group: mkars80
Date: 2009-02-03 12:49:28 UTC
From: Ron
Topic: 596 Message: 596

Hello all,

Steve released version 2.4 of the firmware and I was able to burn the 16F818 with the hexfile posted in the files section. So far so good!

Now, I want to put my name and call in the welcome text of the MKARS80.
To do that, I must modify the assembler file (.asm) and assemble the modified text file to hex.
So I downloaded MPLAB IDE, loaded the project into MPLAB and modified the .asm file. Then I selected the option "build" from the "project" tab. I then got the warning "Build Failed".
If I do this with the original (unmodified) .asm file I also got a build error. So I decided to use MPASMWIN, an assembler from Microchip, that came with my Velleman K8048 PIC programmer. If I load the MKARS80-V2_4.asm file into it and press "assemble", I get "908 lines assembled" and "235 Errors". This also happens if I use the original .asm file.

I clearly do something wrong, but I cannot see what. Is there anyone out here who can help me a step further, please??

Thanks a lot!

73 Ron pa0rcl

597. Re: PIC-programming - HELP!

Yahoo group: mkars80

From: John
Topic: 596 Message: 597

Hello Ron,

Try the following instructions....

1 Open MPLAB
2 Click on project tab at top then select open from drop down menu
3 Open the folder that contains ALL of Steves latest firmware files
and select HuffNPuff file from within that folder it has an MPLAB icon
next to it.
4 You will now have multiple windows open, you need to see the one
that shows files in a tree format it could be hidden under another
page! From the tree double click on MKARS80-V24.ASM (assuming you are
loading the latest version) this will open the .ASM file for you to edit
5 To add call sign go to line 143 the rem statment on this line tells
you what to do
6 Once changed press ctrl F10 to convert to hex, load hex file to MKARS80

Hope that helps

John (M0TIF)

Hello John,

Well..... it works! Ctrl F10 did not work in my case but I used Quickbuild and that did the trick. After all, the whole thing is easier than I had imagined, once one knows how to do it, of course.

Thank you very much again for your all your help, John, without it I would have been messing around for days, if not weeks.

73s, and all the best!

Now now Ron, no need to put yourself down.

The only problem would come if the hex file included some sort of checksum or parity information that would need to be
recalculated. Perhaps someone can advise on that. Otherwise, a hex file editor might be the easiest way to simply change
a text string.

Hello Nigel,

Well, OK, perhaps I'm not exactly stupid but simply ignorant regarding PICs and the like. I had my training in electronics almost 50 years ago, entered in a different type of trade which had little to do with what I was trained for and picked up my old ham hobby only recently. I feel I missed a lot, in all those years. But I'm learning every day!
With the help of John, M0TIF, I succeeded in mastering my Velleman PIC-programmer, WinPic and part of MPLAB today.

Thanks for your help, I do appreciate it!

Regards,

Ron de pa0rcl

Good afternoon Ron, congratulations on your achievements, I have been following your progress with the Vellermann programmer for the past few days with interest, as you know I am from your era and had also been thinking about purchasing a Vellermann kit next time I am in town. A couple of weeks back it was pointed out that this kit cannot be easily used with a USB / Serial port adapter, although I think there may be ways around this. I was wondering therefore how you are driving your kit (Serial Parallel USB or otherwise) and details of your platform and PC ? If at all possible I would very much prefer to use my laptop (Windows XP Pro and USB only) with an outboard USB to Serial convertor that I already have here, rather than have to use my old retired PCs in the garage. Any suggestions or help would be appreciated about compatability of the Vellermann kit and what files to use with my present setup.

Hello Charles,

Nice to hear from you again. The Velleman K8048 manual explicitly states that serial to USB converters CANNOT be used. I have not checked this, I take their word for it, hi. I have some computers here that are like me, retired, but have RS232 COM-ports. For my PIC-project I found an old Sony laptop with a COM-port, running WIN200O Pro. Thanks to John I was able to make it all work.
Maybe there are more modern ways to program the PIC16F818, but I have not found one.
Anyway, I do not think I will be burning PICs every day so I am happy with what I have now.
Good luck and if I can be of any help I will be happy to.

FB Ron, thanks for your info, well from reading earlier mails on this subject no one on this group so far has succeeded in using this programmer with a USB / Serial convertor with Windows rather than the person who experienced success with Linux. Since it appears to be compatable with the Linux operating system it struck me that this issue is not to do with the fact that a maximum of only 5 volts is available at the USB port, but is a software file problem, or am I mistaken, anyone out there no the likely reason ?
In addition I think, although I may have misunderstood this, the Vellermann kit needs an independent external DC source as well as the PC port to make it work, so presumably the "burning voltages" come from it and are therefore independent of PC and operating system, so can you maybe please confirm this for me Ron.

Even non-native English readers like me were able to understand what you meant, Charles, no problem.

The Velleman K8084 PIC programmer uses its own power source for the burning voltages indeed. I must say it works fine, perhaps i offers too much for what I intend to do with it, but as a kit it is not too expensive and can be built quickly.

Good luck,

73 Ron de pa0rcl

Glad you are getting the hang of it Ron. How about changing other features of the firmware more to your liking - perhaps start by removing the last digit and replacing it with an "M", this shouldn't be too hard.

Thanks Ron, I know you have an excellent command of English, since posting my message I have come across this web site http://forum.velleman.be/viewtopic.php?f=4&t=56
It makes an interesting read as someone is still claiming it can be adapted to USB in spite of many other denials on that site.
Officially Velleman (I got the spelling right that time) claim it is impossible and recommend using their Pickit2 for USB, so out of interest I am going to look this up but expect it will more expensive.
Maybe others will add their comments on here later.

Well, not too hard for you I'm sure, Steve, but my PIC experience is only one day old. I have little or no understanding of what the code in the .asm file really does, although your annotations are a big help. I think I found the lines where the last digit can be suppressed (Buffer_6 call send_char ; 1Hz)?
But since I do not know what I am doing, it is really a matter of trail and error. And time...

Thanks and 73

To get rid of that line simply put a semicolon (;) in front of it and it
will change colour. To add the "M" find the text near the start of the
program "Hz" and add an "M".

Charles, I had looked at this programmer, too, but it does not seem to support 18-pin PICs, alas. At least this is what Velleman says. So.......

Well I can see one problem straightaway it does not support 18 Pin
DILS...so back to the drawing board I guess.

Hi,

I'm not sure if it's of any interest but I posted this message in early January about a very nice little programmer which covers an amazing amount of different devices:-

Hi Tony,
I'm not sure if this helps but I bought a programmer from a guy in China via Ebay last November and the service was good as was the unit. I just checked and they are still available at the same price.

It's connected via a USB port so there is no need for any external supply although one can be connected if the port cannot supply more than 200Ma. It has a 40 pin ZIF socket so it can handle quite a lot of devices.The software is quite reasonable too.

If you would like any other info please let me know.

It works out at about 38 Euro.
73,

John.

Hello Charles,

I have spent ages trying to get K8048 working via USB using windows 98 / XP and Vista with no luck at all. Primarily I use Linux and cant even get it to work on USB with that. I have found a number of links on the Internet saying it is possible but the secret never seems to be advised!

Like Ron I use a very old laptop which I picked up for a few pounds with serial port, perfect for the K8048 and some other radio related projects that insist on serial port.

John (M0TIF)

For something more advanced how about making the display flash on and off as a warning when the battery gets low in voltage or perhaps when the VFO is about to jump?

623. MKARS80 with last digit (Hz) suppressed

Yahoo group: mkars80
Date: 2009-02-03 21:08:18 UTC
From: Ron
Topic: 623 Message: 623

Hello Steve and all,

Easier than I had anticipated I was able to modify the PIC16F818's code to suppress the Hz digit (and also display MHz again). I thought it would make tuning easier. Personally, I was not too interested in the Hz digit as in SSB the last 10 Hz do not matter much for voice readability. Also, all my other rigs do not display the Hz digit, I thought not for no reason.
To cut a long story short, suppressing the Hz digit does make tuning a little easier indeed, but not much. I will leave the present setting for a few days to gain more experience. One advantage is that the + sign indicating the H+P centre comes out better on the display as there is no character on top of it any more, hi.

73 and enjoy the hobby,

Ron pa0rcl

Its not that hard just needs some thought... I will put how to do it on the group sometime so you can experiment, thats the best way to learn to program.

If you really want to you can tidy up my messy timing loop at the begining of the code, won't make it work any better but the code will look nicer!

In the near future I'll try to find out how the code is put together. My programming experience -if I can call it that- goes back to the eighties when I wrote simple software in Basic for my Sinclair Spectrum.....
I'll wait for your input, there is no particular rush and I understand you're very busy, particularly since the MKARS80 sales are booming.

Hi John, yes I did see your earlier posting but thanks again for the reminder.
Since my on-list chat with Ron earlier tonight I have trawled eBay and found what I think are the programmers you are referring to and have taken the plunge and ordered one from Shanghai !
So now I am in at the deep end Ron, but if it pays off and I get the support they have promised I should have something which meets my needs for a while as it seems to be a very versatile unit, but I may need to pick someone's brains later, so hope you John are able to provide some of the answers to my questions by then Hi Hi.
Thanks and 73 de Charles G3OTH

Ron there are at least 2 sellers on there, both are very similar
products if not the same. The one in China is at:
http://cgi.ebay.co.uk/ws/eBayISAPI.dll?
ViewItem&ssPageName=STRK:MEWAX:IT&item=280308152649
But maybe on reflection I should have ordered from Hong Kong as it is
quite a bit cheaper at:
http://cgi.ebay.co.uk/ws/eBayISAPI.dll?

Ron you probably already know that unfortunately Yahoo does not copy long links very well so you will have to manually combine the separate lines shown above to make up the full address and get the link to work in your address bar.

Perhaps rather then buy a different programmer you might consider buying a PCI card that provides not one but 2 serial ports for use with your existing programmer. Hopefully I understand correctly what the problem is here. I think I paid about $9 - $11 Can delivered here for a serial card (from Ebay) and it works quite nicely for use with any serial devices that I have tried though I do confess that I have not yet tried it with my serial programmer as I have that connected to an older computer that actually has a serial port.

Hello Ron,

I stand corrected, I have removed the Hz digit and reinstated the "M"
in front of Hz and it looks really good. Plus it makes it slightly
easier to tune. It's good fun this programming.

I will have a look at Steve's challenge now :-).

Hello Tony,

After a day's experience without the Hz digit and with "MHz" I'm
inclined to adopt this mod for good.
Tuning is somewhat easier, one only sacrifices 5Hz accuracy on the
average and in my opinion the display now simply looks better.
If you have an idea where to start with Steve's idea about a flashing
display I would be gratefull if you would share it.

Thanks and 73 Ron pa0rcl

Ron, the description for both includes our PIC and also 2 others
which I use. I cant comment on the software however as the links come
with the product, but I am confident they will be ok, John would know
more about this I guess as he already uses one. I am sure looking at
the pics that the HK unit is exactly the same as the China unit, only
the China deal says it includes a 9 pin to 9 pin cable and an adapter
for 6 pin PICs, even so the HK has to be the best deal I reckon in
hindsight.

Hi,

you are an impetuous bunch! [:)]

The link to the one I bought is
http://cgi.ebay.co.uk/Mini-USB-PIC-Microcontroller-Programmer-for-Microc\
hip_W0QQitemZ290293803401QQcmdZViewItemQQptZBI_Electronic_Components?has\
h=item290293803401&_trksid=p3286.c0.m14&_trkparms=72%3A1688%7C66%3A2%7C6\
5%3A12%7C39%3A1%7C240%3A1318
<http://cgi.ebay.co.uk/Mini-USB-PIC-Microcontroller-Programmer-for-Micro\
chip_W0QQitemZ290293803401QQcmdZViewItemQQptZBI_Electronic_Components?ha\
sh=item290293803401&_trksid=p3286.c0.m14&_trkparms=72%3A1688%7C66%3A2%7C\
65%3A12%7C39%3A1%7C240%3A1318>

I didn't need a serial port and the number of devices supported plus
the quite nice software led me to buy that one.

The price in USD was the same but at the exchange rate then it cost me
£34.91

73,

John.

Hi John
Thanks for the info.....impetuous.....yes at least in my case and I plead guilty as charged.....however Ron has not bought one yet so he reserves his defence.
In mitigation your site did not come up when I looked last night but it may have been a better bet specification wise had I seen it.
Superficially all three look very similar to me unless you can spot otherwise, so let us both know if you can detect any serious problems or drawbacks, too late for me but it could be of benefit to Ron and others.
Thanks es 73 de Charles G3OTH

639. MKARS80 presentation Norwich ARC

Yahoo group: mkars80
Date: 2009-02-05 11:17:49 UTC
From: John
Topic: 639 Message: 639

Yesterday I accompanied Steve G6ALU to the Norwich Amateur Radio Club to assist with one of his presentations on the MKARS80. We enjoyed the meeting and enthusiasm of NARC members.

I have uploaded a few photos of the meeting in the photo section (pending Steve's approval).

John (M0TIF)

From: Liz & Tony Buckland
Topic: 644 Message: 645

Hello Ron,

OK on the experimenting, always worth trying, and agree on your comments. I'll keep mine with just the 1Hz digit suppressed in readiness for the CW adapter.

Having the 10:1 reduction drive on mine the tuning appears to be pretty good in conjunction with the fine control but take on board your mod using a ten turn pot and three switched ranges, an interesting mod.

I would happily have an S-meter in place of the Bat indicator but not sure how that could be done without a major mod or whether in fact it could be achieved with firmware changes somehow?

I have changed my "+" for an "=" for the centre tuning indicator and I like it, what a fussy lot we are :-).

I haven't had too much spare time recently to play with the firmware programming challenges, I think this will take a bit of time but will get onto it soon.

Have fun experimenting,
73 Tony ZL3HAM

PIC-programming is fun, indeed. I went one step further -just as an experiment- and suppressed the 10Hz digit also.
>Quite frankly I do not miss that digit either. In SSB voice
>communications, a 50 Hz average deviation from the other party's
>frequency is hardly or not noticed. I used to have a Drake TR7 that
>also had only one digit after the MHz-point (3.755.0) and my Kenwood

Hi Steve & Friends,

Just a comment about that review now I've looked a little closer.

The "Pros" were absolutely spot on but the only "Con" Care needed when handlimg small components!

So NO MORE small parts Steve, can I have a nice big polished wooden case too to match my Radiogram? [:)]

73,

John.

652. Melting point of Varnish ?

Yahoo group: mkars80
Date: 2009-02-16 10:05:36 UTC
From: g8xlh
Topic: 652 Message: 652

Hi All,

I have just completed the MKARS80 kit and I am pleased to report that all is working OK.

I now have to get it boxed up, which I am not looking forward to as metal bashing is not something I enjoy or very good at.

However like the review in PW I also had a bad connection on one of the coils which I think was caused by the insulation not melting on the enamled copper wire.

My normal Weller iron with a "7" bit had difficulty, and in the end I used "Maplin" iron with the temerature set to Max.

I wonder if you know what the correct temperature should be to melt the Varnish, and it might be worth adding a note to the manual. On the thicker wires I could scrape the insulation away, but not for the thiner stuff.

Well done to the club for a good project.

Regards

Alan G8XLH

yep finaly got it going well the next thing is to look at the tuning mod for the vfo and the varactor tuning mode .wondered if any one has written this up using some pics to help etc any web pages to look at with this in mind

656. US Frequencies

Yahoo group: mkars80
Date: 2009-02-20 00:24:29 UTC
From: pulsarair
Topic: 656 Message: 656

I just ordered a MKARS80 but do not have it as yet. I live in the US. I'd like to adjust the VFO for US phone frequencies (3.7 to 4.0 Mhz). If I do this by either adjusting the variable cap or take a turn or so off the VFO coil to shift the VFO upwards, will I have a problem with the PIC telling me I am out of band? If this can be turned off, no problem as I could care less about being warned I am "out of band".

Also, does the kit now come with NPO caps in the VFO?

Lee,

They will often cover the frequency range you need as designed but in case
its probably wise to add a turn to the VFO coil when you wind it.

The software doesn't indicate out of band so you are OK there!

Built the MKARS80, that arrive promptly, thanks Steve.

Made one stupid mistake and put Q22 the wrong way round, apart from that worked first time.

Only annoying thing I have now is that when I bolt Q1 to the case using the pad and bush it blows the fuse...I'm assuming it's a short somewhere with the case of Q1 and the ali mounting case.

Do ya think I can find it :)

Will keep trying...great kit.

Rob (m0rpf)

660. Blowing fuses : A suggestion.

Yahoo group: mkars80
Date: 2009-02-20 16:08:05 UTC
From: Tony Olewicz
Topic: 659 Message: 660

Bob,
Do a continuity check before connecting PSU - it saves fuses!
My experience - check the deburring on the transistor mounting hole carefully.
(Had to use magnifying glass) the burr might be piercing the isolating pad. Also that the nut-bolt is passing through the insulation sleeve washer correctly on the insulated mounting bits. I found that sleeve too short, so replaced it with a longer one out of the 'junk box'.

Using a hand power drill gave poor results - have picked up a drill stand since as an "Aldi weekly special offer". The difference in accuracy and professional results is amazing.

Only other problem with the kit was the heat strippable enamel.
Solution was to heat strip and 'tin' the leads away from the board to ensure that a good electrical connenction had been made.

Have fun.
Tony

My MKARS80 kit arrived with lightning speed and is now burning a hole on my 'things to do' shelf whilst I am embroiled in a major house refurbish prior to getting married in a few months.

Hopefully I can sneak a few hours on it here and there (when the future missus isn't about) to start slyly assembling the beast.

Regarding the problem with melting the insulation on the copper wire, we used to use a small meths spirit burners in our workshops.
You'd hold the wire in the flame until the insulation bubbled and then quickly wipe it off with a bit of kitchen towel. Then just tin it normally. AND DON'T TRY USING A CANDLE - INSTANT SOOT DEPOSITS! :-)

All the best

Slim Haines G4IPZ

I think this blowing fuse issue is the biggest construction issue at the moment.

Firstly I've checked the heatsink kit supplied; the sleeves I have here are correct, when fitted they pass through the transistor tab, through the insulating sheet and into a clearance hole in the case.

Things to watch:
1. Hole in the case should be a clearance fit for the sleeve
2. Make sure the hole is deburred properly; use a larger drill to slightly countersink it and then make sure there is no burr by running a file over the panel.
3. After the transistor is fitted measure between case and tab to make sure there isn't a short circuit.

If you have damaged the sleeve or insulator let me know and I will post you another.

If this turns out to be a building problem for some causing a short, maybe a nylon bolt and nut on the transistor would be the answer.

668. VFO MODIFIACTION AND FINE TUNE ideas on volume control

Yahoo group: mkars80
Date: 2009-02-20 18:40:15 UTC
From: m1dgq
Topic: 668 Message: 668

hi guys not being an expert on electronics but if you do the mod for the vfo using the varicap does this not make redundent the fine tune pot .secoundly has any one thought of putting volume control on this radio. not having fully cased up mine yet im tryin to do all the mods first any ideas changes etc .

by the way if you use a 50K ohm linear pot you negate the need for the switch as discribed in the mod file on this forum some tell me if im wrong

I don't know if it's the same problem but I noticed that if C38 is adjusted to give 3.45 as I approach that frequency it suddenly jumps to 5 MHz! Settling for say 3.46 or 3.47 then it seems stable. Perhaps a small adjustment of C38 will sort out your problem? The other thing I found was that the starting adjustment should be done after making sure that the trimmer on the polyvaricon is totally out of mesh otherwise strange things seem to happen.

I'm no expert but that's what I have noticed.

Hi Frank,

Have you followed the alignment instructions? Does adjusting the orange trimmer C38 make any difference?

If so have you wound L5 correctly, if yes to all the previous then it sounds like you have a capacitor in the wrong place within the VFO section.

Come back if its still not working!

John, I experienced almost exactly the same effect as you when I built and aligned my MKARS before Christmas. Even your quoted frequencies if I recall were about the same where this jump happened for me. At the time I thought it might be that C38 was suspect in some way or that the PIC program might have a glitch somewhere around that frequency or thereabouts. As however I was able to limit my MKARS80 tuning range from 3458 up to 3845 by adjustment of the Varicon Trimmer it did not present a problem in reality, and my MKARS80 has performed reliably to date ever since. However as far as I am aware I believe it would still display this phenomena if I were to go back to the settings of the Varicon and C38 I had set at the time. Maybe others or Steve might like to comment on this if they have ever noticed this themselves and can offer a possible explanation.
BTW Steve, Ron behind the scenes has been customising your firmware with his Vellerman programmer and even I have managed to enter my Callsign into the 16F818 using the Chinese USB programmer I bought on eBay, it has been great fun but we both have a long way to go to catch up with you Hi Hi

Hi Charles,

That's interesting to hear that it has happened to someone else. As you say it's no problem providing that you keep away from the lowest frequency available. If it's adjusted right to the edge of where it happens then I noticed that moving the main tuning slightly, even in the direction to increase frequency, it would suddenly jump to 5MHz. The lowest stable point on mine is just about the same as yours and since it's outside the band there's no problem. Wonder what causes it though?

73,

John.

678. Sorry Ron

Yahoo group: mkars80
Date: 2009-02-20 21:19:02 UTC
From: John
Topic: 678 Message: 678

I'm very sorry Ron. I just logged onto my mail online and found for some strange reason it had moved your messages to the SPAM folder along with many others which shouldn't be there. I really don't understand the reasoning behind the filters sometime, one message gets through and then anothere which seems to be virtually identical is trashed.
The reason I don't look there very often is that my ISP is BT and since they joined with Yahoo it is difficult to get onto both my online mail and the groups because they have different ID's within Yahoo. If I'm logged into one then log into the other via a different window the first one suddenly takes the latest ID when it's refreshed! Very strange but I don't have to go there often, unless something goes missing of course!
Sorry again,
73,
John.

You are experiencing an undocumented feature found in early versions of the code, from V2.3 onwards this was cured.

This happens outside of the UK band allocation so I didn't see a need to fix it in a hurry!

John M0TIF kindly offered to re-program PICs for a modest charge (please search previous posts), he will even program the PIC so it displays your call sign at start-up. The latest version V2.4 is much more pleasent to use but having the VFO mod fitted is a MUST.

Note that all MKARS80s supplied with version V2.1 of code or later have the VFO mod as standard.

For those that would like to re-program there own PICs the code is in the group files.

Steve, thanks for giving me the explanation to that phenomena.
My firmware was v2.1 at the time if I recall correctly.
As I am now using v2.4 which I downloaded about a week ago to
reprogram my chip, I guess I would not encounter this effect now if I
were to try to revisit the frequencies previously mentioned.

That is also very interesting John.
My btopenworld.com / btinternet.com /BT Yahoo account has been similarily misbehaving over the past week here, putting incoming mail in the Spam box and introducing delays in incoming mail and possibly blocking my other mypostoffice.co.uk account on occasions. This has never happened here before until this last week.

682. Anyone mod their MKARS80 for 40 meters?

Yahoo group: mkars80
Date: 2009-02-21 14:40:17 UTC
From: Terry ONeill
Topic: 682 Message: 682

Here in the US, night time 75 meters is dominated by high power.
Daytime 75 meters is dead.

Here in he US a better band would be 40 especially for us backpackers
(much better antenna options).

Anyone successfully mod their MKARS80 for 40 meters?

The kit looks cool & I am intrigued.

Terry

Thanks for that info Steve.

I just built it and tried setting up with the original V1.1 firmware
just to get it going. My intention was to install V2.4 with my callsign
inserted once I had it working because I didn't expect anything in the
earlier version to upset the alignment, obviously an error in my logic!

Anyway I have just loaded V2.4 with my callsign added and the "jump" has
been fixed, I can set the limits no problem at all.

Thanks for the wonderful support as always Steve.

73,

John.

Hi Terry,

A little off topic & I apologise but did you see the TAK-40 design in QST May 2008? If I could source some PCB's that would be a very nice 40M project.

If Steves project could be adapted that would be even easier of course. Again apologies for the wandering!

73,

John. G4GCL

I will quickly look at the prospect of modding to 40Mtrs, I wasn't keen on
40Mtrs as most seem to use high power!!

Steve G6ALU

I would be interested in the QST article.

Here is a link to the TAK-40 schematic:

http://wiki.tak-40.org/schematics

The TAK-40 is not available as a kit at this time.

Steve Weber, KD1JV has a kit, the MMR40 but the kit is nearly $200!!
http://www.qrpkits.com/mmr40.html

Yours is attractively priced.

Terry

That's an interesting unit, basically a re-worked Epiphyte with a 10MHz IF.
It looks to be a bit expensive for what it is - perhaps I will paint my
cases orange and put them up to $50!

Its interesting to see that he has used an audio tone to generate CW, this
is the same way as my CW adapter works though mine has a two op amp receive
(and transmit) filter but will be external.

689. AGC-control

Yahoo group: mkars80
Date: 2009-02-21 20:56:27 UTC
From: sigurd.veland
Topic: 689 Message: 689

Hi out there!

I have just built and tried some qso's on my new ACARS80. And I am very pleased with it, but i miss an AGC . I wonder if there is someones who have made an AGC and if so, - how did they do it.Perhaps also a simple S-meter can be connected to the line?

I have already bad hearing and I am therefore looking for a safe way of listening as the different tones can be very loud some times, even with a small speaker.

Regards

Sigurd Veland LB5MA

OK, Have sorted the fuse blowing, and guess what, you won't be surprised to hear.. it was the builders fault...yes hands up...it was me :)

I hadn't realised that the whole drilled in the case for Q1, when the board was bolted to the case was infact slightly out of alignment...

I have raised Q1 and it has solved the problem.

Thanks to Chris from Stafford and District for the call, won't need the bushes but the transfers sound a good finishing touch. See ya Thursday :)

When is the anticipated release of the CW module/add on, as I want one?

Thanks again

Robert (m0rpf)

696. some kind of static buster for front end and huff n puff stabiliser question

Yahoo group: mkars80
Date: 2009-02-28 15:39:29 UTC
From: gee3yrq
Topic: 696 Message: 696

Hi thanks for letting me join the group, I intend to purchase the mkars80 kit asap.
Is there some kind of front end static prevention from building up and blowing any associated circuitry??,Also does the pic need blowing? can someone suggest one of these..I've a vague recollection of either Maplin or Rapid having this type of technology available. thanks ian.

Ian,

The PIC comes ready programmed.

There isn't a static discharge path so if you are using an antenna isolated from ground (balloon kite etc) then it would be very wise to either fit a high value resistor (10K - 47K) across the coax terminations either within the transceiver or perhaps inside an accompanying SWR meter.

Some SWR meters by their design have a DC patch between coax inner and outer.

steve, many of our aerials overseas where static was high had the aerial connected directly to ground via a coil which was tapped to get the right impendance and everything else was directed to ground DC wise but isolated RF wise. you wud probably know this anyway, i am trying not to teach you to suck eggs heheheheh de G3ZPA

699. USA users: WWV problems?

Yahoo group: mkars80
Date: 2009-03-01 12:39:22 UTC
From: Bruce Beford
Topic: 699 Message: 699

Hello to the group.

I have received my MKARS80 kit, and am looking forward to the build. Congratulations to the club on what appears to be an excellent kitting effort. Obviously a lot of work goes into preparing each unit.

My question is for primarily any users in the US- Has anyone experienced problems with the 10 MHz IF passing signals from WWV on that frequency? I would expect that perhaps in the eastern areas this may not be an issue, but more so out west as you get closer to Boulder, CO with it's consistantly strong signals.

If needed, I can move the IF to 9 or 11 MHz, adjust the VFO range and reprogram the PIC. I would be interested to hear if anyone has had an actual issue with WWV. I know earlier QRP kits over here were redesigned away from a 10 MHz IF for this reason.

Thanks for any thoughts,
Bruce N1RX

Hi Bruce,
I have my kit but due to other responsibility's I have not built it.
I live in PA and was wondering about the WWW.
Some folks here in the US have their kits up and running.
Hopefully they will respond here and let us know their findings.
I am most interested in this so please keep in touch

I don't know if this means anything but I just tried my Mkars80 and with 10 mhz WWV @ S9+40db It doesn't seem to be a problem here on the east coast. I think we need to get someone on the west coast.

The Milton Keynes Amateur radio Society (MKARS) will be active from the Milton keynes Museum www.mkmuseum.org.uk/ this Saturday and Sunday 7th and 8th March.

I thought it a good idea to see if we can arange an MKARS80 net, suggested time is 10:00 AM UTC on Sunday frequency 3.760 MHz ± QRM, this is the WAP net frequency so if they are active we will QSY.

Let me know if you have any better ideas!

From: mark2w0jmk
Topic: 706 Message: 706

Hi all well i bought the kit and built it all went ok but every time i pushed the tx button there was a buzzing sound coming out of the speaker.
After looking at the pcb for half an hour i found the problem q4 was in the wrong way Oo well out it came and all sounded ok.
Now time to tune the tx side of it and guess what i blew q1 thats it i thought i need a break.
So i have bought two irf510's just have to wait for them to turn up now.

Can i just say as well that the kit is fantastic really well thought out and fun to build just wish it had a signal meter all the best to you all from mark 2w0jmk

Mark, sorry to hear you had problems... how did you blow the IRF510? As long as they are kept cool then they are quite hardy.

If you had let me know I would have replaced the IRF510 free of charge.

Regards,
Steve G6ALU

Hi Steve no probs mate it was my fault pressing the tx button for to long and turning R2 a little to far. popped the fuse and Q1 was very hot put in another fuse and that one blew as well. I removed Q1 and it does not blow fuses now so i suspect it is QI live and learn as they say.

Sorry I don't Ron, I've spent all my time helping builders and bringing the CW adapter ready for release. It is planned to be released middle of next week, I will make an announcement when it is ready and probably only let about 10 kits out to quick builders just to check everything is OK.

Wasn't someone going to try a mod to 40M, if so please let us know how you are getting on.

OK Steve, probably I will give it a go myself. As far as I can see
from the assembler file, I do not think the firmware needs to be
modified, or does it?
BTW I abandoned the idea of an S-meter incorporated in the MKARS80's
PIC, instead of the battery indicator. Too complicated for my limited
knowledge of PICs!
I do appreciate all the work you do helping builders and releasing
the CW adapter and I will wait for your announcement.

Since the MKARS80 is based on the BITX20, you could maybe go to the BITX20 Yahoo group & take a look in the Files section. There you'll find a Schematic for a BITX40. This should provide clues to a MKARS40.

I feel like a bit of a fraud, because I haven't yet built the MKARS80 kit... I was going to add an adjustable AGC to the audio side because of the way AM deafens when there is a strong signal. Penfold's 'Preamplifier and Filter circuits' (a Babani book) has a circuit I was going to look at. My intention was to have a look on the Net, to see how different people have implemented AGC, and design a hopeful-looking circuit. Do a search for AGC schematic and see what you come up with.

30 years after getting my licence, I have started to learn morse code. Steve's MKARS80 kit, with its proposed CW add-on was irresistable. Whilst I am waiting, I bought the PicoKeyer-plus from www.hamgadgets.com and it is great fun! I reckon that it will be a brilliant front-end to this CW mod. Now all I have to do is to build the MKARS80 radio and finish getting up to 12wpm. That's all. What could be difficult about that? er. Ralph (G6GCX)

The CW adapter includes a keyer as an option for an additional ?5 - the design is from DL4YHF see http://www.qsl.net/dl4yhf/pic_key.html and is reported to work well. The PCB is powered by an intgral Lithium battery, I have Wolfgang's permision to use this.

This is made on a break-off section of the main PCB so can be used externally. It was really included to use up a bit of "spare" PCB space.

I have put some pictures of the confirmation prototype in the files section of the group - thanks to John M0TIF for building it with only a component list!

Kits should be available by next weekend and subject to checking component costs (they are STILL increasing due to the ?/$) will be ?20 for the CW adapter with components for the keyer ?5 extra. Postage has yet to be calculated.

£5 is a good price: I paid about $17 for mine. Oh well; that'll teach me to dream ahead. Mind you, I'm still enjoying playing with it.

Hello Ralph

Delighted to hear you have started learning Morse and wish you every success with it. My advice (and there is plenty about) is to learn to read Morse by listening first before ever touching a key to send, you need to recognise each character as an individual sound. 15 minutes a day every day and you will soon be at 12WPM.

Good luck, looking forward to hearing you on the key.

Thanks for the encouraging words, John. I recorded a lot of MP3s from my old G3HSC records and from morsecat
(http://www.morsecat.de/index.html). I have been listening to them in the car, but need to practice writing characters down as I listen to them. My ossified brain is finding it tough going. BTW, there is another Babani book called 'Projects for Radio Amateurs and S.W.L.s with lots of interesting add-on circuits which might be useable with the MKARS80.

723. VFO Mod parts.

Yahoo group: mkars80
Date: 2009-03-18 12:23:39 UTC
From: Mikael Czerski
Topic: 723 Message: 723

Hi,

Does anyone know where one can get MVAM109 here in the UK? and what it should be priced at?

Another thing has anyone attempted doing a VFO mod using 5W 15V Zener diodes or similar?

- Mike

- Mikael Czerski -

Hi Mike,

Try looking on ebay: rfplus have 4 on auction:
http://cgi.ebay.co.uk/Motorola-MVAM109-BIG-Varactor-Diode-40-440pF-Qty-4_W0QQitemZ370173301109QQcmdZViewItemQQptZUK_BOI_Electrical_Components_Supplies_ET?hash=item370173301109&_trksid=p3286.c0.m14&_trkparms=72%3A1683%7C66%3A4%7C65%3A12%7C39%3A1%7C240%3A1318

or zlowe7 in the us:
http://cgi.ebay.co.uk/MVAM109-Tuning-Diode-20-to-450-pf-Good-for-AM-Band_W0QQitemZ150275620030QQcmdZViewItemQQptZLH_DefaultDomain_0?hash=item150275620030&_trksid=p3286.m63.l1177
The us items take about a week to arrive, and work out around £2 each inc postage.

Mike.

Mike, there are a few sellers of these on ebay. Put MVAM109 in ebay search to see them.

Hi Ron
I am sure Steve would not mind you posting the modifications in the files section, and I for one would be interested in reading them should you be prepared to do so.
I am still toying with the idea of making a Top Band version of the MKARS80 or BITX20 but think it will have to wait for the Winter now that the light in the evenings is lengthening here and the WX has improved dramaatically during the last few days, although I hope to still have some time to fit in making the CW kit when it becomes available, before then.

Lets see how you did it Ron, I guess the VFO is now running at about 2.8 - 3MHz? Have you measured the second harmonic of the VFO?

If succesfull it shouldn't be a problem to do a mod kit.

Hello Steve,

Indeed the VFO is running at 2.9 - 3.0 MHz, as the 40m band in the Netherlands is limited to 7.0 - 7.1 MHz. There is no problem extending it to 7.2 MHz, of course.
The alternative VFO frequency would have been 17 MHz, which is too high in my opinion to keep the VFO stable enough, but I have not tried it.
I have adapted the capacitors and the coils in the filters to 7 MHz. Because the frequency doubled from 3,5 to 7 Mhz, I made both the caps and coils half their previous value.
I have tested the receiver and the transmitter and they seem(ed) to work well.

After reading your post I went back to the shack to measure the VFO's second harmonic with the limited means I have and I must say that this component in my RF-output seems to be too strong indeed. For instance if I transmit at 7.050 MHz, I can hear myself also at 5.900 MHz on another receiver. I had assumed that the ladder filter in the driver stage of the transmitter and the filter towards the antenna would filter this out, it probably does to some extent, but apparently not enough. In the original MKARS80, the problem does not exist because the second harmonic of the VFO is at around 7.2 MHz, whereas the filters are probably tuned at around 3,6 MHz, i.e. far enough away from 7.2 MHz.

Perhaps the 2nd harmonic issue can be solved by incorporating a trap filter for 6 MHz or a low pass filter cutting off at 4 MHz or so behind the VFO, what do you think? Or do you have a better idea for a mod? My experience designing or even modifying transceivers is very limited, as I have just demonstrated.

OK Steve, there is no hurry, at least not for me. I barely work on 40m but found it a challenge to try the mod. Besides I will be on holiday starting this weekend.

I changed the preset caps in the BPF in the TX driver and played with them but that did not make much difference, alas. Later today I will mail you a list of the L's and C's I have changed. Unfortunately I do not have an RF generator with sweep possibility or a spectrum analyser.

Another option is to change the VFO frequency to 5 MHz and the IF to 12 MHz, the 10 MHz second harmonic of the VFO can thus be filtered out better by the 7 MHz BPF than 5.9 MHz in the present situation. 12 MHz crystals are as easily available as 10 MHz ones. Another approach would be to make the IF 5 MHz (no crystal problem either) and the VFO 12 MHz. The second VFO harmonic problem would then certainly be solved, but we probably can not keep the VFO stable enough. Perhaps I will give this a try after my holiday. Meanwhile I will also think about a 20m mod.

Good luck with the CW adapter,

Ron de pa0rcl

734. MKARS80 mods/additions

Yahoo group: mkars80
Date: 2009-03-21 20:59:04 UTC
From: Peter Wotherspoon
Topic: 734 Message: 734

Hi everyone.
Is there some place I can look at the updates to the xcvr, or do I have to read all the emails.
I particularly want CW (OK it was sort of promised to me).
Thanks
Peter

The CW adaptor should be available within the next couple of weeks.
Some mod details have been posted in the files section of this group.

CW adapter is on its way, I have the components all I have to do is finish
the manual!

737. Different Versions MKARS 80

Yahoo group: mkars80
Date: 2009-03-22 21:25:47 UTC
From: JEREMY CARVILL
Topic: 737 Message: 737

Hi Steve,

Thanks for the kit, received last week. I've opened it up and had a good look. I also printed off the instructions from the Yahoo Group "files" section. The manual has V.1.2 printed on the bottom right corner of each of the 26 pages but the 6 bags of components refer to Version 3. Is this correct or have I not printed off the latest version instruction manual?

regards,
Jem

Jeremy,

I suspect you got this from the MKARS website, unfortunately the website hasn't been updated in a while. The link to the latest manual is on the box label - here is the direct link to the download page http://myweb.tiscali.co.uk/radiokits/mkars80page.html the manual you want is V1.3.

Regards,
Steve G6ALU

Thanks for your rapid response Steve. But before I cut down another rain forest with the 26 pages I have already printed off, are there any differences between the two versions, ie., can I still successfully build the transciever with the version 1.2 instructions, or are there just subtle changes which I could just alter on the copy I already have?

regards,
Jem

741. Board issues

Yahoo group: mkars80
Date: 2009-03-23 12:28:41 UTC
From: nakor1
Topic: 741 Message: 741

Hi Steve,

I had a wee problem with Resistor-R62. It wasnt in tight to the board so I removed it to reposition it. Unfortunately I didnt count on needing 3 hands and the solder set in the holes. I got a smaller iron and managed to clear the holes, but took the edges wit it, so now have nothing to solder onto except to burnt holes. I assume this will cause an issue later so havent added anything else to the board. Any ideas on a workaround will be greatly appreciated.

Also while I'm on I was winding the toroids T1 & T3-5t & 5t 38 swg. I think I have misread the instructions and twisted two bits of wire & put it thru 5 turns on each side, I think now it may only be one wire from each end with 5 turns as opposed to two wires twisted from both ends - the trifiliar ones were clear enough. This only came to light when I tried two bits of wire twisted for the big toroid & I could barely get it through - never mind trying another twisted pair from the other end. If that makes sense!

Cheers Alan

Topic: 741 Message: 742

Hi Alan,
I'm not Steve but I will help you on R62
1st get a new resister, I think it is a 10 ohm brown black black
1 end goes to ground, scrap a small spot on the ground plane (back side of board),
get it nice and shinny. Use some sanding paper to get it clean, apply some flux and tin the spot.
Put R62 into it holes and solder the ground to your new tinned spot.

The other end goes to C82, install it, trim and bend the lead towards R62
Try to wrap the lead right around the lead of R62, solder it and your set

Hope this helps, May your junk box be full of spare 10 ohm resisters

Save the rain forrest!

From memory the only changes are:
1nF ceramics now used instead of polycarbonate capacitors in VFO,
changes to firmware (no need to download another manual for this) and
order of alignment changed; setting of display bias now the first thing
after display is fitted.

744. MKARS80 - wow

Yahoo group: mkars80
Date: 2009-03-23 15:27:30 UTC
From: philg7bzd@btinternet.com
Topic: 744 Message: 744

Hi Steve and gang.

Cheque was posted last week, and as I checked my calendar the postman rang the door bell. Now thats what I call a fast delivery.

Printed the latest issue instructions from the web, had already read them a couple of times, thats why I sent my cheque off.

Well a couple of hours later I have all of bag 1 on the board, I even have a couple of spare 4k7 resistors?
Yes I have cross checked everything....

Very impressed so far.

Regards

Phil G7BZD

745. MKARS 80 on Air

From: j.w.g.g3you@btinternet.com
Topic: 745 Message: 745

Very pleased with the kit. Instructions were foolproof.

Took just a couple of evenings to build and test

Works fine first a local contact with my son to see all was ok.

Next day a 5/9 contact during the day with a station in Yorkshire not bad from Kent with just 66 end fed wire.

I am looking forward to building the CW option.

Hi Phil,

Lets hope you don't find two of something missing!

You may find a spare 100nF capacitor, this is normal just in case we
miscounted the 51 capacitors.

Hi Steve.

Phew... Thought i'd missed a cap. Yes got one spare.
Started bag 4. But the eyes are playing up, so its time for a rest.
Hope to finish the rest tomorrow. if the station manager allows me.

Regards
Phil G7BZD

Hi Phil,

Lets hope you don't find two of something missing!

You may find a spare 100nF capacitor, this is normal just in case we miscounted the 51 capacitors.

Mark,

I have some displays with backlight although they are not cheap as I have only purchased a few, you will also find that you will need a new case and potentiometers as the displays are thicker.

Displays are ?10 each including post to the UK.

Larry,

Are you OK now, do you need a new resistor (or anything else)?

I have loaded a copy of the PCB trackside to the files section so if people think they have broken a track they can check.

753. G8DIU Mods

Yahoo group: mkars80
Date: 2009-03-24 22:08:45 UTC
From: Peter Wotherspoon
Topic: 753 Message: 753

Can someone give me some description of what the G8DIU mod does?
Where the output goes?
Is that a pot on the 8 volt lead?
Or a reference to an earlier email?
Thanks
Peter

Mark,
I have checked Q13 in my prototype and it just gets warm - if yours gets too hot to touch check its bias resistors.

What version is your kit (what version instructions) and what is the version of your micro (displayed at turn on).

Regards,
Steve G6ALU

759. Build Progress

Yahoo group: mkars80
Date: 2009-03-27 17:57:03 UTC
From: Dean Davis
Topic: 759 Message: 759

I have been building kits for the past 10 years or so and I must say that the folks who designed this little jewel and the ones that kitted did an excellent job. This is the best kit that I have ever built and I wish others would follow in their footsteps.

So my hat off to everyone.

Dean Davis, N7XG

p.s. I can hardly wait to get this on the air.

760. Smoke Test

Yahoo group: mkars80
Date: 2009-03-30 15:12:25 UTC
From: Dean Davis
Topic: 760 Message: 760

I have completed the build and now testing and I seem to have a big problem.

1) The voltage tests on R34 and and VR2 are right on the dot (source voltage is about 12.5, no microphone hooked up).

However with an antenna hooked up:

1) I have no RF gain (i.e. no audio)

2) Turning the tune button does nothing

3) If I touch Q6 I receive AM boardcast

4) If I touch the LM386 I get a loud hum

5) I have started going through the voltage tests and several seem a bit high

6) I have the PIC installed, but not the display

Dean, N7XG

Hi

I had a very similar problem to the one you describe and it was because I had not used enough heat to melt the insulation when soldering the coils to the pcb.

Hope this helps.

You use the heat and strip/tin the wires BEFORE you put them anywhere near the board.

763. TX audio in headphones

Yahoo group: mkars80
Date: 2009-03-30 15:58:10 UTC
From: ki4mmm
Topic: 763 Message: 763

I recently finished my build and everything (tuning, RX audio) works great except that I cannot get any TX power out, and I hear my microphone audio in my headphones when I key up. Is there an common boo-boo that results in this? I'm thinking I may have a short in T5 (but would like to hear some ideas first, before rewinding it). Maybe I have a problem with Q3 and TX voltage keying, but again, I wanted to check and see if there is a well-known goof-up.

No common TX boo boo I know of; first check all the transistor voltages in TX (just in case there is something in the wrong place) then check to transformers are wound correctly and the enamel is removed from the terminations when they were soldered.

Hope theis helps?

Dean,

The radio is very quiet with no signal - you won't get the "normal" no signal noise as the gain isn't excessive.

Nigel,

I pre-tinned all of my toriods before I installed them. I went back and re-soldered all of them, still nothing.

Steve,

I decided to attach the display and it seems to be working.

What I noticed was that when the main tuning dial is counter clockwise
it displays a frequency like 3.911 and clockwise 3.529. I would have
expected that fully counter clockwise it would show the lower number
3.529 and clockwise the larger number 3.911

Still no receive.

769. Re: TX audio in headphones

Yahoo group: mkars80
Date: 2009-03-31 17:21:54 UTC
From: ki4mmm
Topic: 763 Message: 769

All of my transistor and IC voltages check out, other than a few 0V pins on the PIC have a slight voltage - I am thinking that those should not be involved with the audio though. My transformers checked out fine as well.

I am having a hard time understanding what Q3 does in relation to pin3 on the LM386. I am familiar with turning off an audio amp with a R- voltage (i.e., no power) during transmit (as with the BitX), but I don't understand what is happening with a T+ voltage applied to the audio amp? Is Q3's collector pulling pin-3 (volume) to 0 volts?

i guess I should ask, since I don't totally understand the circuit: should I not hear my mic audio in my headphones when I transmit, or is that a feature of this design?

Thanks,
Greg

770. Re: TX audio in headphones

Yahoo group: mkars80
Date: 2009-03-31 20:12:12 UTC
From: John
Topic: 763 Message: 770

Hi,

Just out of interest I connected a microphone to my recently completed radio tonight for the first time and tried it into a dummy load, no 80m antenna yet!

I get power out but also some audio from the speaker, not much but using headphones it would probably seem quite loud.

It probably will not be a problem but I would also be interested to know if it's normal.

73,

John. G4GCL

From: Steve Drury
Topic: 763 Message: 771

Hi John,

Its normal to get a very low level through the speaker so if you are using efficient headphones I guess it could be quite loud.

Once you have it all set up and running you may like to try reducing the value of R5 (drive to mute transistor), 1k should turn it on harder but might introduce a "pop" when going to transmit from receive - solder one across the back first.

Be very carefull when using headphones as the radio doesn't have AGC - local stations can be VERY loud in headphones. The CW adapter (available later this week) has a headphone socket fitted with diode limiter which should help out here.

772. Re: [mkars80] Re: TX audio in headphones

Yahoo group: mkars80
Date: 2009-03-31 20:26:55 UTC
From: Steve Drury
Topic: 763 Message: 772

Q3 is a mute transistor to mute the audio when in transmit, as you note the BITX20 takes the audio supply from the +12V receive supply - I tried this but you get a loud pop on TX to RX transitions.

Check you haven't got any voltage (> 0.3V) on the base of Q3 whilst in receive - if you have it may originate from a faulty transmit PA transistor (drain to gate short).

As per Johns email you will hear a small amount of audio in your speaker on TX but its mostly muted by Q3 being turned on - Q3 is a switch not an amplifier.

Do you have any test equipment; oscilloscope and signal generator or do you know a local Ham who could help you locate your problems?

From: Steve Drury
Topic: 760 Message: 773

Dean,

This is normal and one of the quirks of the little radio - remember that it has a 10MHz IF so to tune 3.5 to 3.8MHz so the VFO has to span 6.5 to 6.2MHz - it has to work backwards!

If you don't get used to it then you can do the varacter tuning mod in the files section.

Have you received any signals yet?

Dean,

This is normal and one of the quirks of the little radio - remember that it

has a 10MHz IF so to tune 3.5 to 3.8MHz so the VFO has to span 6.5 to

6.2MHz - it has to work backwards!

If you don't get used to it then you can do the varacter tuning mod in the

files section.

Have you received any signals yet?

775. Re: TX audio in headphones

Yahoo group: mkars80
Date: 2009-04-01 13:00:17 UTC
From: ki4mmm
Topic: 763 Message: 775

Steve,

Yes, I have a pile of test equipment. I went through everything last night, and at the same time learned some basis Electronics 101 e.g., what a basic transistor switch is :-).

I disconnected the link to T5 and still have the problem, so it is in the mic/audio part of the circuit.

Everything in those circuits checks out fine other than mic audio leaks into the LM386. If I short Q3's collector to ground upon transmit, it totally blocks the leaked audio.

I'm thinking possible fixes might include:

1. Lower value for R28 (and R5) might shunt more current through Q3?
2. Maybe a different NPN for Q3 would work better for me?
3. Maybe C35 is at fault?

Thank you,
Greg

I don't recommend one as the audio chip relies on a good thermal contact with the PCB to get rid of its heat - others may like to tell us if they have used one and the outcome.

Dear Steve,

I have used IC sockets for LM386 in various projects for years,
including LM380s with no heating problems.

My 'Epiphyte' (QRP Club kit, 80 mtrs, VE7QK Derry Spittle) has been
working for several years with 386 in a socket (all 5 chips in sockets)

Sockets can save many problems when trouble shooting.

Regards

Date: 2009-04-05 13:44:25 UTC
From: philg7bzd@btinternet.com
Topic: 784 Message: 784

I am looking for a box/enclosure to fit my MKARS80 into, with the idea of having the display and controls on the face rather than the top. And maybe room for an internal SLA battery.
If anyone knows of a website that they can point me in the direction of I would be gratefull.
Anyone got any ideas on a microphone, can R17 be switched to cater for a dynamic mic rather than an electret ?

Regards

Phil,

Re the microphone - R17 could be switched but be carefull about leads and RF / noise getting in. Any low cost electret works, I have used examples from pound lamd and Tescos.

786. CW adapter availability

Yahoo group: mkars80
Date: 2009-04-05 15:25:02 UTC
From: Steve Drury
Topic: 786 Message: 786

OK, the CW adapter is available but I only want to let the first batch go to UK builders how are able to build it over the next week or so.

The reason for this is that I've only had one Beta builder give me reports on its function, whilst I'm confident of the design I'm always aware that others might want levels etc. setting differently to me.

If anyone would like to purchase one and give me some quick feedback then please send me an email.

Cost for these first kits will be £25 + £3 postage payable by Paypal or cheque, these kits include the keyer option; the first batch (10 parts) have taken Val and myself most of today to kit so we will be reviewing the cost for the next batch.

To make kitting easier I'm thinking of doing away with the keyer option and including this as standard, I will also be looking to rationalise component values (mainly resistors) to make kitting easier.

The manual (version V1.1) will be posted in the group files section later.

Regards,
Steve G6ALU

Hi Steve and Val
I received the CW adapter kit you sent me this morning. I have already downloaded and printed out the manual you posted in the files section last night. Everything looks fine so hope to start assembling things here tonight.
Many thanks again Charles G3OTH

790. Re: TX audio in headphones

Yahoo group: mkars80
Date: 2009-04-09 01:37:08 UTC
From: ki4mmm
Topic: 763 Message: 790

Just an update on my problems....

I went through my radio with an audio and RF signal generator, monitoring with my scope, and narrowed my "no power out" problem to T6 - I had one lead not making good contact. This fixed my TX power-out problem (i.e., there wasn't enough modulated signal coming through before.

The mic audio in my headphones is minimal, and non-existent when using an external speaker.

The result is that my rig is working great, and I made my first contact tonight with a station about 500km away! He gave me a 5-8 report and said my audio sounded great.

In summary, what a nice little rig this is!!

Greg,

So what did you do about the headphone volume.

From: ki4mmm
Topic: 763 Message: 792

Dean,

I had already tried a few different resistors around Q3, but with no luck (most combinations made it worse); so, I still have mic audio in my headphones. Nevertheless, I didn't notice it during my actual QSO last night - I reckon I was too excited about the contact to think about it ;-). I'm not going to pursue it any further as I will probably be excited enough about any future QRP 80M contacts to think about it then ;-). I don't know about other countries, but finding a QRP opening on 80M here in the states is a rare event (between the kilowatt rag-chew sessions at 3Khz intervals)!

It's in the UK, I believe on Saturday mornings.
Search this group for previous discussions.

I'm in the US so can't hear it.

Hi Steve and All
I finished assembling the CW adapter and Auto-keyer yesterday and all parts supplied were as usual complete in every detail and everything went together as per the manual and the kit worked first time. I have photographed each stage and posted these in the Photos section of this Group pending your approval. The auto keyer operates very well but there are still a lot of modes which I need to try out yet after I have fully digested the DL4YHF manual. Thank you again for designing and supplying this very interesting kit.

Afternoon Nigel,

We don't have a regular net, its hard for me to arrange one every week as I'm often either shopping or taxi-ing.

If some one wants to organise a net please feel free to do so, I always manage to pick the wrong time and either the band is dead or Europe wipes us out!

Regards,
Steve G6ALU

Thanks for the report Charles,

Thats three positive reports so far although only one has used it for any length of time. General release gets closer!

Photos have been aproved so all can see them on the group - there doesn't look like many components in it but as Val M6FLO (XYL and owner of Radio-Kits) knows there are quite a few!

From: Jon Carp
Topic: 801 Message: 801

Hi all

Well I finally did it and built the kit. Finished off by fitting the display this evening.

The good news is no smoke, the voltages are in spec and the display works.

The bad-ish news is that I can't get the frequency below about 4.1MHz.

I guess an additional trimmer can be fitted - anyone else come across this and how is it fixed?

Cheers

804. MKARS80 Dead Rx

Yahoo group: mkars80
Date: 2009-04-11 09:19:59 UTC
From: clayro
Topic: 804 Message: 804

To anyone who has an apparently dead Rx,some of the 1N4148 diodes have turned out to be faulty, resembling a resistor rather than a diode.This can prevent the diode mixer from working correctly with the result of weak signal reception.Suggest checking them before fitting.
Bob.

Well I rewound it again, 40 turns per the instructions and it's still
4.308MHz which is exactly what it was before - not the 4.1 that I
mistakenly wrote previously.

So does it need more turns, fewer or an extra trimmer on the tuning cap?

(And yes, I do know the formula but it's so long since I did any
electronic stuff that my brain's gone to mush!) :)

Topic: 801 Message: 807

Jon,

Have you followed the instructions and adjusted the orange preset? If all parts are in the right place and the inductor has the correct number of turns then there are probably two options:

Remove a couple of turns from the inductor or I can send you another core to rewind a new one.

To my knowledge there haven't been any components cause problems in this area.

Regards,
Steve G6ALU

808. Re: [mkars80] MKARS80 Dead Rx

Yahoo group: mkars80
Date: 2009-04-11 13:51:44 UTC
From: Steve Drury
Topic: 804 Message: 808

I always get very concerned when I hear reports of poor quality so I've checked the current stock of diodes.

They come in boxes of 5k manufactured by ROHM, this box is about half used so there are at least 100 kits shipped using them. I checked 250 diodes for reverse leakage on my AVO M2007 digi meter, none registered so were > 30M Ohm. I then tested a sample of abot 20 (at random) for forward voltage and all were within about 20mV.

From this I conclude the parts we are currently supplying are of good quality.

Can you read the numbers on the diodes you have Bob? All the numbers including the date code would be helpfull.

Thanks,
Steve G6ALU

I'm suprised to read this Bob, as the 1N4148s come in a VERY large box I'm still probably using the same ones.

How long agao did you receive your kit?

Also please advise what meter you are using to measure the diodes and what leakage you are observing.

I have used thousands of 1N4148 diodes over the years in both
commercial, and
ham projects. I too use ROHM, and have never found a faulty one yet. I know
someone who used zenners at one time by mistake in a switching matrix,
and that was fun :-).
I would be amazed if anyone else confirmed Bob's problem, truly. Velly
stlange :-).

Cheers Steve

Topic: 804 Message: 812

Hi Steve,

I had the problem that Bob refers to, I found the sensitivity was somewhat lower than I expected. While I was prodding around the front end and mixer area I was a bit surprised to find a fair amount of vfo signal at the rf input to T4. I immediately suspected that I had not wound T4 properly, despite checking it at all the fitting stages. Looking with the scope around T4 showed a very asymetrical vfo waveform just about everywhere, and around 350mV dc on the T4 ends of diodes D12-15. I removed T4 and measured the diode pairs with a Fluke DMM, and found a reading of 215 ohms on one pair. Lifting one end of D14 I measured it as a 215 ohm resistor?? Wow, I've worked in electronics for 40 years or so, and I've never met a duff IN4148 before! I can't explain it, and the culprit is no longer with us, perhaps I should have framed it. Replacing D14 with one of my stock and refitting T4 improved things dramatically. I changed the other 3 diodes as well from the same batch later, as the mixer balance wasn't as good as it could be.
The kit was one of those that were supplied through the NARC earlier this year, I have to say a very nice, clean kit to build, very impressed, and the performance is good too. I don't think you need to lose any sleep over the component quality, I think my dodgy diode was just one of those spooky things that are out to confuse things in life.

> stlange :-).

As it happens someone has come forward having found a leaky diode - Bob please come back with your date of purchase please as I don't know your full name so can't look it up!

I will check the diodes we send out for a while although I know those supplied in the next few kits are OK - I tested them today!

I expect a leaky diode to be one of the least likely causes of any problems but if you have a deaf radio (or are unable to null the carrier on the BFO adjustment) and have eliminated other possible causes please lift one end of each diode and check for leakage in the REVERSE direction.

814. MKARS80 Nearly Alive - hiss in audio output

Yahoo group: mkars80
Date: 2009-04-11 22:25:24 UTC
From: pskb195
Topic: 814 Message: 814

Hi all,

Received my kit just over a week ago and after following the excellent instructions I'm nearly there.

I do have one problem. There is a permanent hiss on the output that is quite loud. Has anyone come across this before and if so any thoughts on how to fix it.

Any thoughts would be appreciated.

As an aside I have to also say what a great kit this is. The instructions are great and the way the bags are put together makes it very easy to get going.

Thanks in advance.

Phil

Phil,

There is always a slight hiss from the speaker due to noise generated within the LM386 audio amp (due to it being used in high gain mode).

I repaired an MKARS80 earlier which also had a loud hiss, I found this due to 10MHz getting into the audio amp - the culprit was an incorrectly wound TR5, embarrassingly this was wound by myself! Another symptom was the receiver was also deaf.

816. [mkars80] MKARS80 totally deaf

Yahoo group: mkars80
Date: 2009-04-11 22:38:19 UTC
From: Jon Carp
Topic: 814 Message: 816

Hi Steve et al

Well the saga continues. I now have the frequency reading correctly so went to set up the BFO - and I have no received signals at all.

I have tried generating a few milliwatts of RF from my Yaesu box and I'd expect to pick "something" up but nothing at all - just gentle background his from the audio stages.

Would I be correct in first suspecting the diode ring? It looks like the diodes are in correctly.

Jon

Steve,

Thanks for the quick response that's a great help. I've played with the receiver and managed to tune into a couple of stations so I don't think it's deaf...

I'll have a look at TR5 and check that I've not made a mistake.

Once again great kit.

Thanks

Phil

Set up the transmit side (BFO and TX output bias) then test transmit - if
you get full power then the transformers are OK.

Topic: 814 Message: 821

Jon,
Don't automatically suspect the diodes - 1N4148s are normally very reliable and if you purchased the radio in the last few weeks they are from the current batch which look OK.

As you have a correct frequency display that means the BFO and VFO are OK, try touching the non grounded ends of D19 and D20, you normally get a loud crackle / buzz.

First thing to do on a dead receiver is measure all the transistor voltages, this will point to a DC problem if any are incorrect. You may also like to check to see if the transformers have been soldered in properly; it is common for the enamel to have not burned off the enamelled copper wires.

Let me know how you get on,

Steve G6ALU

Hi all.
Just a quicky re the diode problem.
I have come across 1N4148 and similar diodes suffering quite quickly from prolonged application of the soldering iron when fixing into a pcb.
The usual effect is a change in reverse resistance when measured on an AVO or similar 'proper' meter LOL

So keep the soldering time as short as possible.

Hope this might help

Hi all.

Am after a microphone, the only ones down at my local Maplins would have cost me more than the radio, Pc world are no better.
Have tried my mic from my Icom271 (its an electret), but it sounds a bit ragged around the edges when listened to on another set, LED does indicate correctly as per the manual.
It may be RF, as its not yet boxed, have started drilling the case.
I cannot find a pound shop locally....

An electret capsule (FS43W) is only ?2.49.
Although the web site says it's out of stock you local store might have them.
I'm sure you can invent some way to mount it.

Hi all

I also have this problem, I am looking for a friend who has already bought a suitable mike to purchase one for me and post it to me at my expense as I am unable to source one in Guernsey.

I have three now that I have online from you no where and none work properly.

If you read this Steve it might be helpful if you could supply a mic to people like me as an extra. At least we would know what we are buying would work correctly with this cracking little rig.
Just an idea.

Hello Phil,

An old PC mic will do the job indeed I got mine from one of these cheep shops but if you don't any of these close by have a look at Maplin www.maplin.co.uk/ they do just the eletret module for a couple of pounds and if you order anything from them before Tuesday post is free.

Look forward to working you on the MKARS80

Regarding mic for mkars80, i just use an old cb mic and so far have had very good reports on my audio.
If you want an electret insert maplin do one the number is FS43W under £3
Regards Jim

Hello Phil,

An old PC mic will do the job indeed I got mine from one of these cheep shops but if you don't any of these close by have a look at Maplin www.maplin.co. uk/ they do just the eletret module for a couple of pounds and if you order anything from them before Tuesday post is free.

Look forward to working you on the MKARS80

You could always try Bardwells in Sheffield. They do mail order. That's were mine came from.
Used the other wire on the stereo connector to provide PTT with a flat click type push to make switch, they had a box of them on the counter for 80p each. The mic I got had a round base, so that's where the PTT got 'superglued' to.

http://www.bardwells.co.uk/

Bowood electronics are worth a try as well.

http://www.bowood-electronics.co.uk/

I have no financial connection with these folk, just bought loads of stuff there over many years.

Hi All

Looks like I will be getting a Maplin insert, and yes they are in stock locally.
That other website is great for its lack of information. I think it comes down to people selling things they don't really know about. I too have been bitten in the past.

Look forward to getting the case finished and on the air.

Regards and thanks all.

An electret capsule (FS43W) is only £2.49.
Although the web site says it's out of stock you local store might have them.
I'm sure you can invent some way to mount it.

Phil,
Make sure the BFO frequency and PA bias has been set up properly before testing the audio. If using a dynamic microphone remove the bias by lifting one end of R17, alternatively fit a 1uF electrolytic capacitor in series with the microphone.

A quick search found the following from CPC CS12160 or CS13516 both are less than ?3 each but beware of CPCs handling charge on low value orders.

I could purchase some and distribute them but they would retail at some where around ?5 each, I could obtain and sell on electret capsules - these would cost about ?1 each, postage would cost the same again though! This wouldn't be a problem if ordered at time of purchase.

Hi Steve.

Did you set it all up prior to sending it back to me ?
Will be going to Maplins sometime this week, have got a whole week to play radio. Maybe even finish the case off.
We use CPC/Rapid/RS/Maplins at work so if I get desperate I can order through them.

Thanks

Hi All,

Another good source of suitable mics are your local supermarket,
they often have a computer related section and very often have cheap
headsets with mic or computer desk mics.

The only thing I would advise is to change the lead on these as the cable is
very poor.

Check out also local markets and boot sales.

Hi Jim well i have been using the Mkars-80 for just over three weeks now and my furthest contact is 1187 miles with YL2GB plus i have had good contacts with E77DX RW2F and SP7MTF.

You are right it is an amazing radio with very good results. I would really like to have one the same for 20 meters as well.

By the way the antenna system here is an inverted L with four counterpoises running on top of the ground.

Colin,
It suggests to me that the VFO is running at 8MHz, can you put your
frequency counter on TP VFO and see what you measure.

Does the main tuning capacitor alter the frequency? I don't understand why
C38 makes no difference as it is straight across the main tuning gang.

Q19 is an MPSH10 which has a different pin out to the BC547 etc.

From: Jon Carp
Topic: 824 Message: 846

Hi Steve

Checked the transformers as you suggested and indeed a couple of leads weren't properly tinned - now sorted.

I now need to get myself a dummy load (sure I had one when I was last on the air in '98 but can't find it now) so I can continue with the transmitter config but the receiver sounds just fine!

Bit of solder slung out of the window, one hand on the case and the other on the central heating radiator to provide some sort of an earth and I received F8CHM, DL4KAO and several UK stations. Nice clean audio and no significant drift! It's like getting on the air for the first time again! Not bad after nearly 30 years licenced!

However, and it's a big however, I totally messed up the case so please could I buy a replacement off you? I hope to get to Stockwood Park so could get it and a dummy load there to save postage.

Cheers

Jon (with a grin that just won't go away!)

We plan to be there if you can wait that long Jon - would be interested in meeting other builders as well!

There is a rumour that an MKARS80 has crossed the pond - England to Canada - I'm trying to get confirmation.

You can make a simple dummy load, just put sufficient resistors in parallel for a couple of Watts dissipation and somewhere near 50 Ohms. If you are just adjusting the bias and mixer balance you won't need to transmit any power.

I know about the grin, we've all suffered it!

All the best,

Steve G6ALU

Ok thanks Steve,...my apologies with respect to mention of Q19,..the voltages I have are correct with it being an MPSH10,...I have no reading as such from TP VFO,...looking at the display I have a letter 'U',..next to the battery voltage of 13.6V,.would this mean it's not locked ? the main tuning capacitor does NOT alter frequency and C38 makes no change to the freq, either,...thanks for your help

From: Steve Drury
Topic: 843 Message: 850

Colin,

Could that be a strange symbol rather than a "2", if so it suggests the VFO isn't oscillating. Yes the "U" indicates the Huff and Puff is not locked.

Check carefully around Q11, as the voltages are correct I suspect there is a blob of solder or dry joint some where.

Regards,
Steev G6ALU

Hi Steve,..yes it is a strange symbol,...a bit like a cross between " 2 + @ ",..i'm a bit annoyed because i'm not a novice builder having previously built wx sat, receivers and softrock kits,...i'm convinced it's something simple because all my voltages seem to be within tolerance,...one thing I had noticed was that with both C35+C39 both polarised caps.,..with power supplied any movement of the capacitors or a finger placed on them from the track side causes a bit of feedback type hum in the speaker,..I don't know what their purpose is,..but I have replacements if needs be,...could they be swapped over for 2 x 1 microfarad 50 volt caps. ?,...i've also reflowed most of the solder joints in case of a dry joint,..I will persevere and keep you informed of any results,....kind regards Colin GM7TFN

Yes I'm sure its the oscillator (VFO) not running - those capacitors are normally sensitive, the audio amplifier is running at maximum gain.

Check again around the VFO, is there continuity across the VFO inductor?

Which Weather satellite receivers did you build?

853. Help - No RF out

Yahoo group: mkars80
Date: 2009-04-15 10:39:10 UTC
From: rfullagar@worldonline.co.uk
Topic: 853 Message: 853

I have come use to my mkars80 in anger and discovered I have no RF coming out.

Receiver works fine, LCD shows what it should.

Calibrated the PA, on tx with R2 fully anticlockwise I had 190ma so adjusted to 240ma. TP measures 10Mhz according to my frequency counter. When I press PTT I hear the relay click and the LED lights up. I am in the process of checking voltages and revisiting the mixer calibration should I look anywhere in particular (being a novice builder I need the pointers). I have tested the mic and it works fine, and checked and rechecked its wiring to the 3.5mm jack. Q1 measures what it should on on rx and tx.

I did have a problem of the fuse blowing when putting the PCB into the case, could I have blown something?

I have read a thread on the forum about no RF, check that already.

Thanks in advance.

Hi Robert,

First I don't think you have blown the output transistor as the current rises when adjusting the bias. The current in TX seems low, I normally see about 250mA (at 12.5V) before I adjust the bias, when adjusted it is 300mA.

Just as a quick check see if Q5 the driver transistor (ZTX651) is getting hot when pressing the PTT - it should do! You are doing the right thing by checking voltages first.

Regards,
Steve G6ALU

Steve

I have the voltages and some look way out especially Q5.

Table below shows the results, input voltage was 12.8v from an SLA battery.

I await your diagnosis :)

Regards

Robert (m0rpf)

	Receive			Transmit	
	Emitter	Base	Collector	Emitter	Base	Collector
Q2	14mv	14mv	14mv	30mv	0.68	0.68

Hi Steve,..Ok thanks for your advice Steve,..i've managed to get it receiving the problem was a couple of suspect resistor joints in the area of the VFO,....a few heart stopping moments though I have to admit,...now comes the next of stage of TX alignment,..you asked about the wx receivers,...i've done quite a few of the RIGsat RX2 receivers, one for myself and three or four others for friends again they were nice little kits which were fairly easy to get going,..but I think they've been probably replaced by something more modern by now,...ok once again thanks for your comments and support it's appreciated very much,....kind regards Colin GM7TFN

I'm glad you are receiving now - more than half way there!

The RIGsat RX2 was based on one of my VHF transceivers, the software was mine!

Topic: 853 Message: 858

Hello Robert,

I don't have much time this evening but I wonder if Q5 is the wrong way round or is one of its bias resistors the wrong value?

Steve G6ALU

Steve

I have the voltages and some look way out especially Q5.

Table below shows the results, input voltage was 12.8v from an SLA battery.

I await your diagnosis :)

Regards

Robert (m0rpf)

Steve

Anything is possible :)

Q5 flat side faces Q9 as per the PCB overlay, the rounded edged side towards R2.

No sure what the biasing resistors are but R19, R16, R22, R24 and R25 those around Q5 have the correct colour coding..

regards

Robert

For those builders in States, these electret
elements can be purchased at any Radio Shack
for about 2 dollars. Or $.50 at ALl Electronics:

http://www.allelectronics.com/make-a-store/category/390/Microphones/1.html

All electronics offers three different models,
one in a rubber shock mount, one with leads,
one without leads.
I have not yet received my kit but based on
experience with QRP rigs in the past that use electrets
(BITX20A, MMR-40, etc) I am going to use a computer
mic or adapt an old CB mic.

862. Alignment For USA Band Allocation Coverage

Yahoo group: mkars80
Date: 2009-04-23 05:08:12 UTC
From: e_larson_esq
Topic: 862 Message: 862

I've posted my order and am eagerly waiting for my kit to arrive.
During alignment, will adjusting C38 and the trimmer on
the Polyvaricon allow for the freq coverage up into
the 3.6-4.0 MHz range? (USA Extra Class SSB priviledge)
Or 300 KHz somewhere in that range?
Has that been the experience of anyone who has completed the project?
Or will I perhaps have to pad a small cap
across C38?
TNX, Ken AD6KA

Ken,

I don't remember the lower end on mine, but it is pretty far down there; my upper end came out around 3.955. I plan to someday add a turn or two to my inductor to bring it up.

Hi Folks.

Sorted the microphone out, nice little electret capsule (Maplins) sounds better than my Icom mic.

I am now searching for a 1.5 inch vernier dial drive for the tuning, its one of the ones with a 8:1 ratio, cannot seem to find on in the UK, Tried the ones of some of my other kit but at 2 inches in diameter they are too big.
Any info would help.

Regards
Phil G7BZD

Hi Steve

The type I was after has the slow motion drive built into a vernier knob assembly. Is there a particular Jackson drive that would fit, as I know theres not a lot of room.

Regards
Phil G7BZD

Phil,

I'm not sure of the vernier knob you refer to but when ordering remember the capacitor shaft is 6mm.

Hi John.

Photo has answered my one question, I see you can cut the shaft down.
Will get on on order.

Many thanks

Rob,

Q5 looks as though it is the right way round - check for a short between
base and emiter with the transistor left in circuit.

I have just checked one here and it reads 440 Ohms.

MKARS80Ken and All,

Mine did! I just adjusted the cap, and I have just over 400 khz., from just below 3.6 to just above 4.0 mhz.

I've posted my order and am eagerly waiting for my kit to arrive.
During alignment, will adjusting C38 and the trimmer on
the Polyvaricon allow for the freq coverage up into
the 3.6-4.0 MHz range? (USA Extra Class SSB priviledge)
Or 300 KHz somewhere in that range?
Has that been the experience of anyone who has completed the project?
Or will I perhaps have to pad a small cap
across C38?
TNX, Ken AD6KA

875. Help- Mixer Balance

Yahoo group: mkars80
Date: 2009-04-27 10:33:48 UTC
From: g2e1hjt
Topic: 875 Message: 875

I have just completed my MKARS80 kit and i have hit a problem when trying to set the mixer balance.
While monitoring the waveform at the emitter of Q16 using a scope, moving R59 has no effect at all, but adjustment of C103 does produce a change.I have checked R59 off the board and it seems to function OK. Where should i look to resolve this problem?
I am a complete novice so any suggestions as to my next move would be greatly appreciated.

Steve

hmmm...must have a short as I'm not reading 440ohms :(

Had a good look around nothing obvious, so I unsoldered and reseated Q5 which has resolved the problem. I'm reading 240mA for the pa on transmit (adjusted to 290mA) and I now have approx 4.5Watts out.

Are you still taking orders for the CW module? Last post I saw said something about quick builders only and you may rethink the price due to effort to package the kit.

I am off work for a few weeks so have some time on my hands :)

877. Re: [mkars80] Help- Mixer Balance

Yahoo group: mkars80
Date: 2009-04-27 20:05:03 UTC
From: Steve Drury
Topic: 875 Message: 877

First adjust C103 and then R59, remember R59 is a multi-turn preset; turn it at least 10-15 turns in one direction before doing the same the other way. Both controls are interdependent - whilst adjusting make sure you don't have any audio into the microphone, I plug in a mono jack plug which shorts the PTT.

878. Re: [mkars80] Re: Help - No RF out

Yahoo group: mkars80
Date: 2009-04-27 20:02:17 UTC
From: Steve Drury
Topic: 853 Message: 878

Some times its like that, thin slivers of solder can be nearly invisible.

Yes I'm taking orders for the CW module now, I've not advertised the fact as few have been built and I'm eager to get any problems sorted (none so far....) before I get deluged with orders.

I re-evaluated the time it took us to pack the CW adapters and have now fixed the price at ?28, this includes the keyer which is no longer an option. Postage will be an extra ?3.

Ken and All,

Mine did! I just adjusted the cap, and I have just over 400 khz., from just below 3.6 to just above 4.0 mhz.

I'm just repairing a radio - found out that if the VFO coil only has 33 turns (should be 40) it will tune across the full band with many kHz to spare!

Hello Steve & others,

Just for interest with the small trimmer on the top of the varicon
out of mesh I get 3.464 - 3.932, which is a 468KHz spread.

882. Component location grid

Yahoo group: mkars80
Date: 2009-04-28 15:25:02 UTC
From: Master Ice
Topic: 882 Message: 882

I hope you don't mind Steve, but I've posted a (hopefully correct) PDF file of the pcb layout with a grid overlay along with the component numbers and their corresponding grid positions.

Hopefully some members may find this useful if their eyeballs are a tad aged (as are mine)

It's in the groups Files section HERE
<http://uk.groups.yahoo.com/group/mkars80/files/MKARS80%20Component%20gr\
id/>

Like I say, I hope you don't mind me posting this.

All the Best

884. Prelim transceiver checkout done, all OK

Yahoo group: mkars80
Date: 2009-04-29 03:34:34 UTC
From: Steve Ratzlaff
Topic: 884 Message: 884

I received my kit yesterday and have the board finished and working today. Initial checkout indicated no VFO output--I found a cold solder joint where I didn't fully strip one lead of the L5 VFO coil. Once that was corrected, the display showed a proper frequency, and I could proceed to do the initial adjustments. My L5 was initially 5.6 uH with 40 turns; by spreading the turns I got it down to 4.9 uH and left it there (using the aade.com LC meter to measure L5). That seems to work fine. I get 3554-4000 kHz tuning range.
For mixer balance, with C103 arbitrarily set to midpoint, R59 gave a clear minimum adjustment using the 100 mW range of my WM-2 power meter, showing zero on the meter. The modulation LED also began to glow when this adjustment was done.
The hardest part of the board construction was getting the #38 stripped wires into the holes for the 3 trifilar transformers. There were no missing components, with one extra 0.1 uF capacitor left over. I don't have a microphone yet to test actual SSB output. I think I have a properly-working board now, and will proceed on to the mechanical construction of the enclosure to hold the board.
For the very low price of the kit, I did not expect the board assembly to be very difficult, but I was wrong--it was much more challenging (and enjoyable!) than I expected. This kit gets very high marks for building-enjoyment!

Hello John,

Thanks for the email. I was actually after the drilling template for
the new CW Adapter. I have already successfully built three MKARS80
kits and now await the arrival of the CW adapters to go with them.
They will be a great addition.

888. resizing enclosure drilling template?

Yahoo group: mkars80
Date: 2009-04-29 18:31:28 UTC
From: Steve Ratzlaff
Topic: 888 Message: 888

Is there a way to re-size the enclosure drilling template and then print it out? When printed from the .pdf drilling template file, it's far too small. The size can be zoomed in and out, but it can't be printed at that new size; it always goes back to the original size when a print is tried.

73,
Steve AA7U

Hi Steve.

When printing from Adobe acrobat check the setting of the Page Scaling option on the Print window is set to "None".

Give that a try.

Hi Ray and Slim,
Thanks for the comments.
I figured out how to set to A4 page size, but couldn't find anything about scaling options. As a result, nothing is changed from the original too-small printed size.

898. Re: [mkars80] resizing enclosure drilling template?

Yahoo group: mkars80
Date: 2009-04-29 22:50:00 UTC
From: Steve Ratzlaff
Topic: 888 Message: 898

Hi Steve,
Sorry to be a bother, certainly wasn't intended. I had already tried printing with that "none" option chosen (and also tried the several other options, just in case one might work), and using the A4 paper size; nothing changed from the original attempt--still too small when printed. (I was thinking for the scaling options, that there would be ones to choose the actual layout size; mine is always fixed on either 91% or 96%, and neither actually change how the printout appears; it's always the same too-small size.)

But I've now finished the enclosure and have the board fitted more or less properly, using the old fashioned method of layout with ruler and pen, setting the board on the lid of the case and measuring, marking the enclosure for the display cutout and the other holes. Except for the rear BNC hole which is way too large and elongated, everything turned out "acceptable". I found it's important for the 3 holes for the front controls to be approx. 1/2" size (or larger), otherwise the board doesn't want to go in place. But the knobs cover the holes so it doesn't matter that the holes are big.
At any rate, the project is more or less finished now, with the board in place, bottom cover on, knobs fitted, power applied for a last check. (Getting that LED to be near the hole took quite a bit of work, my cut and try measurements weren't very close for that hole....)
I was hoping I could make the resized black border template print out properly to put around the LCD cutout, but since I can't get the drilling template to resize, the other template won't either, and I'll just live with that, and finish up by putting my own lables on the controls. Not a problem!
Thanks again for the great project.
73,
Steve AA7U

We seem to have at least 13 MKARS80 radios in the USA

If anybody thinks that I can assist them get their radio working, I will be at both FDIM (with a working radio) and
Hemvention and happy to assist.

I'm still confused as to why your template wouldn't print the correct size, if I presented the information in a different format (*.tif, *.gif etc) I suspect you would still have had the problem.

The template shows the correct size and shape holes to drill - I've done several now and they line up OK.

I wonder if there is someone local to yourself who can print them out?

I just tried it and have the same problem. The 142.3 mm width dimension prints out 132 mm on my sheet of paper. Too small. I am not a computer wizzard and have no idea why it doesnt print out 1:1. If the dimensions were given, I would just cover my box with masking tape, mark the appropriate drill points, drill and remove tape. This way, one would not have to actually paste a template onto ones box. There aren't that many drill points to make this solution not of value. Just my opinion.

From: LEE BAHR
Topic: 888 Message: 902

Well, I just played around with this and I found a "fix" for my computer set up. I am running Windows Home Vista Premium and am using a HP All-In-One Ink Jet Printer.

I first downloaded the template, then I right clicked PRINT while my arrow was on the template, I then clicked on PROPERTIES, then I clicked on the EFFECTS page, then highlight the PERCENTAGE OF NORMAL SIZE BOX (you put a dot in the circle), I then changed the setting from 100% to 108%, then I clicked on "OK", then I clicked on "OK" to print. Out comes a size very close to ideal. For the 142.3 mm width dimension my printer now prints it out to actually be 142 mm . The key was to increase the size to 108%. As I said in my prior post, I am not a computer wizzard but this worked on my computer set up.

I wonder if it may be worth checking the printer's settings actually in the Windows printer folder.
There may be some default setting in the printer driver which is over riding the Acrobat settings.

> I just tried it and have the same problem. The 142.3 mm width dimension prints out 132 mm on my sheet of paper. Too small. I am not a computer wizzard and have no idea why it doesnt print out 1:1. If the dimensions were given, I would just cover my box with masking tape, mark the appropriate drill points, drill and remove tape. This way, one would not have to actually paste a template onto ones box. There aren't that many drill points to make this solution not of value. Just my opinion.

We seem to have at least 13 MKARS80 radios in the USA

If anybody thinks that I can assist them get their radio working, I will be at both FDIM (with a working radio) and
Hemvention and happy to assist.

Subject: Re: [mkars80] resizing enclosure drilling template?

Well, I just played around with this and I found a "fix" for my computer set up. I am running Windows Home Vista Premium and am using a HP All-In-One Ink Jet Printer.

I first downloaded the template, then I right clicked PRINT while my arrow was on the template, I then clicked on PROPERTIES, then I clicked on the EFFECTS page, then highlight the PERCENTAGE OF NORMAL SIZE BOX (you put a dot in the circle), I then changed the setting from 100% to 108%, then I clicked on "OK", then I clicked on "OK" to print. Out comes a size very close to ideal. For the 142.3 mm width dimension my printer now prints it out to actually be 142 mm . The key was to increase the size to 108%. As I said in my prior post, I am not a computer wizzard but this worked on my computer set up.

I'm still confused as to why your template wouldn't print the correct size,
if I presented the information in a different format (*.tif, *.gif etc) I
suspect you would still have had the problem.

The template shows the correct size and shape holes to drill - I've done
several now and they line up OK.

I wonder if there is someone local to yourself who can print them out?

Hi

You probably wont find one with a ptt switch fitted but there is usually space in the base of most models to fit a switch yourself.

Hi,

I am using a Yoga speaker/mic from Maplins stock code QT21X. It comes with a 2.5/3.5 mm dual plug, and is wired for voltage PTT switching, but is easily rewired for use with the MKARS80 after fitting new plugs. I used one of the speaker wires for the separate PTT line.The screen acts as return for both mic and speaker.

Mike G8EEY.

910. Full 500 kHz tuning range mod added

Yahoo group: mkars80
Date: 2009-05-02 19:14:31 UTC
From: Steve Ratzlaff
Topic: 910 Message: 910

I've been having fun playing with my newly-built MKARS80 rig. At first I had poor receive sensitivity, but after advice from Steve, found my error--Q17 installed backwards! Just your basic assembly error, which I had not properly examined the board for, after assembly, as noted to do in the instructions. Now it receives with good sensitivity, measured at -113 dBm MDS (0.5 uV). Since I only use headphones, I made a simple mono plug to stereo jack adaptor to plug into the speaker jack.
I've been playing with the VFO and have found that adding turns to L5 gives a wider tuning range. For mine, 43 turns (5.7 uH measured with the aade.com LC meter) gives a full 500 kHz tuning range (actually about 550 kHz). C38 is adjusted to set where either the start or finish occurs (I set mine for the start, around 3498 kHz). Now I have the full 500 kHz tuning range--ready to add the optional CW adaptor now.
I haven't made a mic yet, but have checked the power output, feeding a tone in from an audio signal generator. At 3.8 MHz I got an easy 5 watts out, and power stopped increasing as I increased the audio drive at 6.5 watts output. This is a very fine rig!
(I used Windows Paint program to make a black border that I printed out and pasted around the display--that worked just fine, since I was unable to print the display Template at proper size.)
73,
Steve AA7U

Try adjusting C83 the BFO frequency - as the BFO also supplies the micro clock and hence the frequency counter reference you will find the displayed frequency changes with BFO offset.

Mark,
I've been thinking about this one - please confirm you have the latest firmware V2.4 (shown on the LCD at start-up).

Does the display continuously change in frequency so won't let the Huff and Puff lock? If so it may be worth changing C50 the 10uF electrolytic, let me know if you need one.

I spent some time on a radio recently where the leakage in C50 was too high, this caused the symptoms I describe.

hi steve yes the firmware is v2.4. i have made a mistake on the frequency it happens on 3.775 MHz not 3.750 MHz but i think that wont make a difference.

the display locks say on 3.775.000 and then the u will appear and the frequency will go up a few hertz + will appear and it will stop but the u will appear again and on and on and on i don't get the three lines at all just moves from u to + and this will happen when the radio has been on for some time so i dont think it is the initial worming of the radio.

the radio has been on now for 0ne and a half hours and it is still on the move from 3.774.800 to at the moment 3.775.270 from mark

918. Re: TX is 100 Hz high. What might I look at?

Yahoo group: mkars80
Date: 2009-05-16 11:33:58 UTC
From: ve3xj
Topic: 914 Message: 918

Hi Steve:

I also consulted with VE33EUR because of his expertise on QRP building, and he said essentially the same thing. (Pat is to be pitied, he is primarily a CW op. I guess you can lead a horse to technology, but you can't make him use it! hi hi) I suspect that the solution to the problem is a slight tweaking because in my manual, it says to adjust it to 9.9999 MHz, whereas I see in version 3 of the manual, it should be adjusted to 10.000 MHz. So I will do that sometime today. (I want to get a linear amp that I picked up for my 817 up and running today. Not much to that - remove the existing connector and install an Anderson Powerpole.)

Thanks so much

Jim, VE3XJ

919. Three cheers for Steve

Yahoo group: mkars80
Date: 2009-05-18 14:39:02 UTC
From: g1zez@ymail.com
Topic: 919 Message: 919

Hi,

I am a new poster to the group but wanted to add my thanks to Steve for putting together such a great kit.

I ordered mine a couple of weeks ago and it turned up a couple of days later with every part present and correct down to the last washer.

I found the instructions clear and easy to follow, and after 3 gentle construction sessions the circuitry side was complete. The receiver worked first time but the transmitter wouldn't key - one missed solder joint on the relay coil. As soon as that was fixed it sprang into life.

Alignment also seemed to be straightforward and more forgiving than some simple radio designs I have played with - with no coil cores to adjust and so few trimmers I was expecting to have to squeeze turns on toroids etc. to get flat-ish power output over the whole band but it tuned up very easily. Receive performance seemed very good as soon as the mixer balance and BFO frequency were adjusted close to where they should be. The transmitter gave me a perfect modulation envelope when fed with a two tone test oscillator and about 4.5W out into a dummy load. The stabilised VFO and frequency display were very welcome additions to the design really add to the ease and enjoyment of using it.

I finally got it boxed up over the this last weekend and will be lashing together a mic for use with it tonight. I am currently using an ML-40 mag loop aerial from g4tph.com which tunes up nicely on 80M and requires no ATU so this is going to be a perfect portable set once I box up a sealed lead-acid battery in a matching case.

This kit has been a joy to build and I can tell it is going to be equally fun to operate. I cannot believe that such a well thought out kit with such high quality components (I am thinking particularly of the PCB) can be produced for £50.

Many thanks to Steve and good luck to the other constructors!

Brian, G1ZEZ

Hi,

Any update on the CW adapter?

Dean, N7XG

Hello Dean,

I'm now shiping the CW adapter in small numbers - I have a few in stock. I will send you ordering info by private mail.

Steve G6ALU

From: Steve Drury
Topic: 913 Message: 922

Mark,

This one has me baffled!

The VFO is purely analogue so I am surprised the Huff and Puff refuses to lock on particular frequencies. If you would like to return it to me I would willingly sort it for you - I just ask you pay return postage.

Regards,
Steve G6ALU

Hi,

I am a new poster to the group but wanted to add my thanks to Steve for putting together such a great kit.

I ordered mine a couple of weeks ago and it turned up a couple of days later with every part present and correct down to the last washer.

I found the instructions clear and easy to follow, and after 3 gentle construction sessions the circuitry side was complete. The receiver worked first time but the transmitter wouldn't key - one missed solder joint on the relay coil. As soon as that was fixed it sprang into life.

Alignment also seemed to be straightforward and more forgiving than some simple radio designs I have played with - with no coil cores to adjust and so few trimmers I was expecting to have to squeeze turns on toroids etc. to get flat-ish power output over the whole band but it tuned up very easily. Receive performance seemed very good as soon as the mixer balance and BFO frequency were adjusted close to where they should be. The transmitter gave me a perfect modulation envelope when fed with a two tone test oscillator and about 4.5W out into a dummy load. The stabilised VFO and frequency display were very welcome additions to the design really add to the ease and enjoyment of using it.

I finally got it boxed up over the this last weekend and will be lashing together a mic for use with it tonight. I am currently using an ML-40 mag loop aerial from g4tph.com which tunes up nicely on 80M and requires no ATU so this is going to be a perfect portable set once I box up a sealed lead-acid battery in a matching case.

This kit has been a joy to build and I can tell it is going to be equally fun to operate. I cannot believe that such a well thought out kit with such high quality components (I am thinking particularly of the PCB) can be produced for ?50.

Many thanks to Steve and good luck to the other constructors!

Hi Mark and Steve,
My rig is doing exactly the same thing !
If you go on 3.775mz or a few hundred hertz either side, the huff puff is constantly locking and unlocking, if you go to 3.777mhz or 3.773mhz etc or any where else I have tried so far, it locks fine !!
Let me know if you find anything.

It doesn't matter how much testing you do there are always unwanted features
in software, this is one of them!

Please don't look for faults my radio does it as well, I will (try) and find
the bug ASAP and make an update available for any one who wants it.

Regards,
Steve G6ALU

>Hi Steve,
No problem, as you say there will always be the odd glitch, the radio works very well, I have thoroughly enjoyed building and using it.
There is plenty of space on 80m so it is not a problem, I am certainly not looking for faults, I mentioned it only because I noticed it had been posted on the forum.
Keep up the good work.

928. Re: 3.7500 huf and puff wont lock

Yahoo group: mkars80
Date: 2009-05-22 15:17:54 UTC
From: panzerbeeb
Topic: 913 Message: 928

Hi Steve,
On my unit the huff and puff changes at 3.774.100 MHz. Up to this frequency teasing the vfo up or down in frequency produces error bars to left or right of L (lock). Above this frequency teasing the frequency up gives error bars to the left of L, teasing the frequency down gives no error bars and goes instantly to unlocked, hence no correction is applied, the frequency just drifts upwards. The next change point is 3.775.360, above which life is stable again. Interestingly setting the frequency above ...360 and acheiving L (lock) is fine, but if the frequency is drifting up from the problem area under unlock conditions, it will continue past the point at which lock should be achieved. I don't know if this helps with the diagnosis at all.

Regards, Mike, G8EEY.

Ron,

Please can you put the PIC code you modified into the files section so that I can experiment with it on my MKARS80.

Regards
Colin

931. 10 Hz digit suppressed

Yahoo group: mkars80
Date: 2009-05-24 09:22:49 UTC
From: ronvingerling@ymail.com
Topic: 931 Message: 931

Colin, the assembler file is in the files section in a folder named PA0RCL. Look at lines 536 and 537.
Good luck,

Ron pa0rcl

932. Re: 10 Hz digit suppressed

Topic: 931 Message: 932

Many thanks Ron,

I've just re-programmed my PIC with your code and I prefer it now with one digit less and also the reading in MHz.

933. How about a net on 3.753MHz LSB @ 21:00 Sunday ?

Yahoo group: mkars80
Date: 2009-05-29 22:16:04 UTC
From: Colin Lowe
Topic: 933 Message: 933

For those that are available how about tuning up at 9pm (BST) on Sunday and trying a few MKARS80 to MKRS80 contacts?

I for one will be on 3.753MHz + or - 5KHz at 9pm on Sunday all going well.

We are doing another special event at the Milton Keynes museum on Sunday,
its a bit of a tall order but I will see if we can get set up for 9:00AM.
The call will be GB2MKM, the event is a telephone day see:

Subject: Re: [mkars80] How about a net on 3.753MHz LSB @ 21:00 Sunday ?

We are doing another special event at the Milton Keynes museum on Sunday,
its a bit of a tall order but I will see if we can get set up for 9:00AM.
The call will be GB2MKM, the event is a telephone day see:

http://www.mkmuseum.org.uk/visiting/vis-telday.htm

Didn't you know I had just re-furbished the Tardis?!

Sorry I didn't read the earlier emails properly..... perhaps I will stay in
bed a bit longer.

Hi everyone, G3ZSV, just completed my MKARS80, fantastic- worked right out of the packets! I've not tested the TX yet but the RX seems fine. I'll be listening tomorrow but I'm afraid I can't TX- too frightened at the moment as I had a pacemaker fitted just over a week ago and need confirmation from the makers that it's ok with amateur radio!!!!
Congratulations Steve, fantastic documentation just about foolproof (well I did it!!)

Hello Glyn,
Congratulations on it working 1st time.

I'm sure your pacemaker will be OK, the RF from mobile phones is much more likely to cause problems than 5W of RF at 80M but I don't blame you on getting confirmation first!

Regards,
Steve G6ALU

947. Frequency stability, temperature and Huff n Puff.

Yahoo group: mkars80
Date: 2009-06-13 11:16:33 UTC
From: m0heu
Topic: 947 Message: 947

I am enjoying slowly building this excellent kit as time allows, (work, baby, wife and garden must come first!).

I would like to house my effort in a bespoke case to provide a more traditional front panel layout and a loud speaker and have a suitable case. It used to house a commercial P.S.U. - it is well ventilated at the sides and has mountings at the rear for a fan.

Here's the thing, I have a little experience of oscillators drifting with temperature change and know that fans and ventilation can actually make things worse. Alternatively, I have read rumours here about people using fans to combat frequency drift caused by warming of the polyvaricon capacitor. I intend to use varactor tuning.

I acknolwedge the presence of the Huff and Puff circuitry and even almost understand it! I want to make sure I have not overlooked anything before drilling the case.

So, can anyone share experience or thoughts about whether my case full of holes is a potential problem?

Many thanks,

Steve / G7HEU.

Hi Steve, I've just completed mine in the case supplied and find the frequency stability excellent. In fact I've not encountered any measurable drift during the few weeks that I've been using it. The amount of heat generated seems minimal and, in my opinion, would not justify a fan. I'm also considering varactor tuning but why not just build it with the standard variable cap first to prove all is working ok? I'm about to do the slo-mo drive mod which will make a big difference to the ease of tuning but my brain can't get used to the reverse tuning direction! Hoping the varactor mod will be capable of rectifying that.

949. MKARS80 Kit Arrived !!

Yahoo group: mkars80
Date: 2009-06-15 22:01:58 UTC
From: jarnold144
Topic: 949 Message: 949

Hi All,

My MKARS80 just arrived!! I really anxious to start construction.

Any advice or recommendations from anyone before I take my first step or make any fatal mistakes??

John, WA6YSY in Washington state USA

Hi John

From my experience the kit is simple to build but make sure you tin the coil connections well and ensure you use sufficient heat when soldering them to the board.

Hope all goes well.

John, my best advice is don't rush it! I used a binocular magnifier on a head band and worked on just 3 components at at time- that way they are easily identified on the board. I was trained to solder to US military standards which insisted on 1- place component, 2- clinch leads ie bend to retain component, 3- snip leads close to board, 4- solder, 5- inspect.
Definitely tin all the coil wires before locating in the board.
Re soldering- I used 22 swg multicore solder and a fine tip 50W iron.
Mine worked first time- it really is great fun.... real radio again.
Good luck 73 Glyn G3ZSV

From: Colin Lowe
Topic: 953 Message: 953

All,

A couple of weeks ago Glyn G3ZSV and myself had a QSO, MKARS80 to MKARS80 both on 5w and managed a QSO over a distance of 195miles fom Devon to Leicestershire.

If your around on Sunday at 9:30pm, tune in on or around 3.690 MHz and we will see how many MKARS80's we can get on the net.

73 de Colin G1IVG.

How about a net in the morning? We will be at Milton Keynes Museum for the Museums on the air event using call GB2MKM.

9:30AM sounds good to me.

From: trance612000
Topic: 955 Message: 955

Hi Folks,

Finished construction of MKARS80 a couple of days ago, and had my first QSO using it yesterday - excellent, think I am going to have to look at upgrading my antenna for better results on 80m though.

Posted a few pictures on my website here:

http://www.furcot.com/MKARS80.htm

regards

George G7GQC

OK, we did have a net this evening:

G7HEU Steve - not on a MKARS80!
G1IUG Colin
M1EEL Mick

And thanks to DF1KBM for vacating the frequency.

We will try 9:30 AM next Sunday on 3.690 or there abouts... its not easy in the evening on QRP!

Conditions were challenging to say the least. However, I can say that G6ALU, G1IVG and M1EEL were all a true 5/9 at some point - all be it briefly!

I was excited to hear very good TX audio from the MKARS80s when the signal strength allowed critical listening. Hopefully my own kit will be finished in time for the net on Sunday morning.

Thanks all,

Steve - G7HEU.

958. Circuit Diagraam

Yahoo group: mkars80
Date: 2009-06-24 17:57:56 UTC
From: dawsonr45
Topic: 958 Message: 958

Am I the only one who hss had difficulty reading the circuit. The components and connections are clear enouth but the component identy and values are illegible. I've printed it on photo paper and blown it up to A3 but no good. I can build it withour this but fault finding is going to be impossible.

Richard

Hi Richard,
You are not the only one!

I put a circuit diagram in a picture format on the website:

http://myweb.tiscali.co.uk/radiokits/radio-related/MKARS80/MKARS80%20-%20Hi%20res%20schematic.jpg

Please download it, open and print it using your favourite paint program.
This way you can print only that part you are interested in.

Regards,
Steve G6ALU

Topic: 958 Message: 960

I wish someone would re-draw the diagram. It is fuzzy and the light blue parts labels make it even worse. No program is going to correct this. The schematic in it's present form is unusable. Why in the world would anyone draw the diagram using light blue labels for parts? I tried printing in only "grey scale" with no improvement. The resolution of the diagram is just not there. In grey scale you still can't read the labels.

961. Circuit Diagrams you can Print on A4 Printer

Yahoo group: mkars80
Date: 2009-06-24 19:59:25 UTC
From: Paul
Topic: 961 Message: 961

Hi All,

Reading the messages earlier today, I have made 3 files which you can print on a normal A4 printer.

You tape them together and you have yourself a schematic you can work with.

The will print in landscape mode and start Top left and finish bottom right of a grid.

The files are called:-
MKARS80 Circuit Diagram - Prints on 9x A4 sheets (3x3)
MKARS80 Circuit Diagram - Prints on 16x A4 sheets (4x4)
MKARS80 Circuit Diagram - Prints on 25x A4 sheets (5x5)

Hope they help.

Snip...

"Why in the world would anyone draw the diagram using light blue labels for parts?"

The drawing conforms to a professional standard and works perfectly when viewed within the original design environment, yours is the first complaint though about the colour!

I can easily change the colour to black but its the size and font that matter. The diagram really needs to be broken up and re-drawn into separate parts, I will see what can be done.

Steve;

It won't matter what the color is. Right now the resolution is so bad there are not enough pixels in the file to print something clear enough to read. The blue even makes it worse. I'd like to hear from anyone who can tell me they can read this file. I'm talking about the labels. The wiring is OK, not great but readable. Anyone, can you see the labeling well enough to read it?

Steve, whomever has the original drawing needs to recapture it with greater resolution and then distribute this new file. Nothing is going to improve the resolution of this old one.

worse. I'd like to hear from anyone who can tell me they can read this file. I'm talking about the labels. The wiring is OK, not great but readable. Anyone, can you see the labeling well enough to read it?

OK, thanks to Steve, AA7U, I now downloaded the new schematic posts in the file section from M0TZO which were put there in the last day or so. That worked. I had been printing the earlier posted schematic which was terrible. I'll now paste everything together and I can read the schematic with ease.

Thanks, Steve, you were a great help. I also learned a lot today about human nature and took notes.

73,

Lee, w0vt

If this is the file you can view it very clearly on screen
http://myweb.tiscali.co.uk/radiokits/radio-related/MKARS80/MKARS80%20-%20Hi%20res%20schematic.jpg

Using IE6, at first when the file opens resolution is very poor but leave
your mouse cursor in middle screen for a few seconds and an enlargement icon
appears in the bottom right of the screen (not the task bar). Click on the
enarlement icon

Lee,
In answer to your criticism I have generated a new schematic:

http://myweb.tiscali.co.uk/radiokits/radio-related/MKARS80/MKARS%2080%20-%20Large%20print.pdf

I find it quite readable even when printed at A4 size, let me know what you think?

Hi Steve,

Is there any significance in the fact that the re-drawing date is Christmas Day 2009? HI

You are certainly not the only one who has and is having trouble reading the diagram; neither the original nor the newest one is readable. I must have spent 20 or 30 minutes trying to improve the diagram including the greyscale bit.

Hopefully someone will rise to the challenge, get rid of the pale non-photo blue, and enlarge the symbols and values to a usable size.

Cheers to all & 73, John WA6YSY in NW Washington state USA

The diagram problem is an interesting example of how different PCs seem to respond to the same input.
I've never had a problem with any of the diagrams either in PDF or JPG format.
However as was rightly observed, particular browser software often plays about with how the image is presented no matter what format the data is in.
Personally I have long used firefox in preference to internet explorer because of it's image and file handling capabilities. However I often find that people utilise their software in the default mode when often a slight tweeking via the options offered can make things far more usable.

Anyway no matter what I'd like to thank Steve for the speed of the amazing support he offers for what is a quite amazing product.

Hopefully once my wedding is out of the way I may actually get a chance to finally build my kit and actually join the operating MKARS80 ranks world wide as opposed to just owning the kit ! :-)

Hi Steve etal,

Yes latest diagram is much better; I can actually read the values etc. Thanks for the redo. Now I'd better get with it and build the rig hi, hi.

From: dawsonr45
Topic: 980 Message: 980

Yes, much better now, but only just fits on an A4. I'm intrigued by the date on which it was/will be redrawn.

For those who are interested in a "Digital" alternative to a 10 turn pot for producing a varactor tuning voltage it looks as if the next issue of SPRAT may be worth looking at!

I know no more except that it may be just what I have been thinking about, we will see. [:)]

982. Help!

Yahoo group: mkars80
Date: 2009-06-30 09:11:09 UTC
From: Jack
Topic: 982 Message: 982

Finished the MKARS80 PCB last night, got the reciever aligned and its working really well.

But...

Moved onto the transmitter set up. I should set R2 so the current drawn is 50mA higher than recieve. I have 120mA on RX, and the lowest I can achieve on TX is 250mA.

Also I can turn R59 and C103 any way I like and there is no carrier on TX. Just seems to work as it should. I'm not complaining, but that wasnt expected :)

TX adio is bit distorded when I listen on another reciver, but that will be proved when a more distance reciever is used.

Anyone got any comments which may help me?

Very impressed with the kit so far. Well made and good value.

Jack,
I think you have misunderstood my instructions, the 50mA increase is during transmit.

Set your meter to read current and put the radio into transmit mode - the best way to do this is by plugging a mono jack (no wire attached) into the microphone socket. The current will read about 250mA, now adjust R2 SLOWLY until the current rises by 50mA. That's all there is to it!

Now set up R59 and C103 as per the instructions and you will find the distortion will disapear. Make sure the BFO frequency has been set correctly as this will also affect the transmit audio quality.

Best of luck.

Now that makes MUCH more sense :o)

I'll try that when i get home from work. I'm sure it'll be fine then. I had a brief on air contact last night and the verdict was "crystal clear", but only if I spoke loudly. Correct R2 setting will help that I have no doubt.

Thanks for your help.

Well my MKARS80 is now operational and working well. May I suggest another sked for this Sunday 12th July at 09:30? This time I shall leave the TS-520S off so it should be an even match! I will ask the moderators of this group to let me know if further sked requests are off topic.

I want to add that I've had a great deal of enjoyment already from building this excellent kit and would like to thank Steve / G6ALU for making it available. If anyone is unsure about buying one I can recommend the purchase.

Steve G7HEU.

No its not off topic!

OK for another sked at 09:30 british summer time this Sunday the 12th, I
will be at MK museum again using call GB2MKM.

Thats 9:30 in the morning, 3.690MHz ? QRM - this may be 10kHz or more away.

I worked Steve this morning - despite a couple of local difficulties. Not the world's greatest DX contact at about 60 miles but I was pleased with it :-)

Local difficulties? Well firstly my remote mounted auto tuner 'locked' twice and it took a while for me to realise what was happening and then to traipse to the end of the garden to reset it. Twice. I presume it was a coincidence since the same arrangement is used here with other QRP rigs.

Secondly, (and other new builders may find this useful), there was deep fading of signals - so much so that for a moment I thought my MKARS80 had a problem. In fact I think it is fine but was revealing my lack of familiarity with an AGC free receiver. Switching between the MKARS80 and my TS-520S signals were of similar readability, good or bad, it's just that the very weak were also very quiet on the MKARS80. I realise that is to be expected but the effect was more pronounced than I had anticipated.

All good fun!

Steve G7HEU.

991. Today's sked

Yahoo group: mkars80
Date: 2009-07-12 19:23:23 UTC
From: Steve Drury
Topic: 991 Message: 991

Pleased to say today's sked was successful with 8 MKARS80s in total:

Me G6ALU Milton Keynes
Alan G4MDR Newport Pagnell (Temporary 50ft long wire)
David M3LSM Leeds
Glyn G3ZSV Plymouth
Adrian G7HSA Ludlow
Steve G7 HEU Swindon
Alan M1CXK Dartford

I also heard faintly Mick M1EEL in QSO with Alan M1CXK.

As can be expected signals weren't all that big but most of us could hear / work each other OK. I plan on having a regular sked on 3.690MHz at 9:30 on a Sunday morning - I will advise regarding next weeks though as I will probably be at Roade car boot sale - perhaps I can do it from there!

I think it was Alan M1CXK who suggested we should call (and listen) on 3.690, I.E. make it our preferred frequency - after all its the centre of QRP activity.

Steve G6ALU

992. Potential obscure problem now finally identified and corrected !

Yahoo group: mkars80
Date: 2009-07-12 21:29:04 UTC
From: g3oth
Topic: 992 Message: 992

Since building my MKARS80 last Christmas and using it successfully albeit intermittently mainly on receive since then, it appeared to behave impeccably each time it was powered up. However in recent weeks I noticed it had developed an AF related problem insomuch that although everything displayed ok at power up, no audio or amplifier noise could be discerned, sometimes for up to 2 minutes on occasions, after initial switch on. Furthermore this recovery time seemed to be directly related to the period of time which had elapsed between successive switch ons.
Various reasons for this went through my mind, a dry joint perhaps, LM386 or component ageing or instability of some sort, before I was finally prompted to remove the lid to investigate and probe the DC voltages on the LM386 immediately after switch on whilst it was in this "sleep" mode.
Measurement of these DC voltages indicated that with 12.00 volts on pin 6 (supply), pin 5 (output) was sitting at 11.43 volts and pin 3 (input) was sitting at 0.25 volts. No wonder the RX sounded dead. When finally audio became discernable the voltage on pin 5 had dropped to 9.25 volts and that at pin 3 had dropped to 0.16 volts. Further monitoring indicated that these voltages gradually fell such that after about 15 minutes they were as expected, that is approx 6 volts on pin 5 and 0 volts on pin 3.
Examination of the internal circuit diagram of the LM386 revealed that a 50 K resistor is present between pin 3 and ground, thus it was deduced that for 0.25 volts to appear on pin 3 a current of 5 uA must be flowing through this resistor, and as in this condition the Darlington connected pnp non inverting input transistors inside the LM386 are cut off, this could only have come via the junction of Q3 and R28. As it seemed unlikely that Q3 could be the source of this current it was reasoned that it must be flowing via R28 as leakage current through C35 from the positive potential at the collector of Q6.
A check on the specification of maximum leakage current in the Maplin Catalogue for a similar size of electrolytic capacitor for C35 (1uf @ 100v as supplied by Steve in my case) revealed that this could be as high as a crazy 18 uA.
Whilst the applied voltage in the MKARS80 is much lower, it was reasoned that a starting leakage current of 5 uA falling exponentionally over a period of several minutes to less than 1 uA was not beyond the realms of possibility, and would explain my observations. Even a 1 uA leakage current could result in a potential of 50 mV at pin 3 which translates into an 1 volt output offset or 7 volts DC at pin 5.
As a result of these findings I have now removed the suspect standard C35 aluminium electrolytic capacitor and replaced it with a 1 uF @ 35v tantalum device and am now always measuring almost zero DC offset on pin 3 and 6.4 volts on pin 5 at switch on.
Should any other users be confronted with a similar experience I would recommend this simple substition.
Regards Charles G3OTH

Charles,

A good bit of detective work. I know of one other that has audio problems but I believe this is intermittent when running so I suspect it is due to a dry joint or similar.

A quick look suggests a 0.1uF ceramic might be as good as the load resistance appears to be around 50K, I will make this change if I hear of a widespread problem. I'm not sure why I went for a high value in the first place.

Regards,
Steve G6ALU

FB Steve

Yes, since the 3 dB cut off frquency at present using 1 uF and 10K for C35 and R28 is about 15 HZ, I dont think the audio response would be compromised significantly by going up to 150 Hz and using a 0.1 uF ceramic.
Having thought about the problem further I have since realised I could have also confirmed directly by calculation the presence and magnitude of capacitor leakage current by measuring the pd across R28.
Too late now, as I dont appear to have any with the Tantalum Bead substitution Hi Hi.

Interesting, probably my bit of wire is the problem! [:(]

Does anyone know what frequency they ended up on?

73, John.

Frequency was 3.690MHz which I believe is the main QRP frequency.

Topic: 988 Message: 998

This morning I have just been listening to the podcast that Martin mentioned.
The interview with Steve was very interesting and I was pleasantly surprised to hear that there are now over 700 kits in existence distributed worldwide.
Congratulations Steve and again many thanks once again to you, your XYL Val and all those involved at MKARS for your efforts to date.
I put out a call on 3690 KHz this morning at 9.30 BST but heard no one, so I think no MKARS members must have been around today.
Yesterday I worked about ten stations up and down the country from GM to the South coast all of whom complimented me on my audio quality, so am sure I could have worked into Milton Keynes had anyone been on from there.
I will try again next weekend if anyone is interested in working me up here in Northumberland.

Hello Charles,

There was every intention of holding a net this morning; we attended the Roade hamfest and was there by 8:30 with an antennae up. At 8:45 the skies opened and we had to move indoors so sorry to all that were listening out for me.

I will try again next Sunday at the same time but please feel free to hold a net if I'm not there!

Regards,
Steve G6ALU

Why not hold a net even if I'm abscent

1001. OOB firmware modification

Yahoo group: mkars80
Date: 2009-07-21 14:08:21 UTC
From: Matthew Robinson
Topic: 1001 Message: 1001

Hi all,

I've finally got around to adding my Out of Band modification to the MKARS firmware. With my modified code (available in the files section) the MKARS shows an OOB warning when the frequency is set below 3.5MHz and above 3.8MHz. As I'm from Australia it also shows OOB between 3.7 and 3.776MHz. The Australian 'hole' is clearly commented in the assembler code, just remove it and recompile to remove it.

If I get a chance I will look to see if I can get the MKARS to show band plan information.

HTH,

Matt

1003. Anti hiss mod for MKARS80 audio amp

Yahoo group: mkars80
Date: 2009-07-24 08:14:22 UTC
From: absorbentgnome
Topic: 1003 Message: 1003

Hi everyone

I was a little disappointed with the amount of hiss coming from the LM386 on the MKARS80 kit. An anti-hiss mod sorted out the problem - solder a 10k and 10nF capacitor in series between pin 8 of the LM386 and the negative lead of C2 (the speaker output), This significantly reduces the hiss :)

I read about a possible AGC mod for the receiver - can anyone post the files or email them to me?

My transceiver is boxed up now and I am very pleased with it - thanks Steve!

Thanks
Dan 2W0UZO

1005. Fault finding

Yahoo group: mkars80
Date: 2009-07-24 13:51:54 UTC
From: penketh5@btinternet.com
Topic: 1005 Message: 1005

Hi, I assembled the kit a couple of months ago. When first powered up I found the audio to be very low, and just a few spurious signals heard. No amateur signals at all.
Steve suggested that the coils may not be soldered.
I have now returned to the kit after doing jobs in and around the house.
I have checked all the coils and I feel confident the they are correct and soldered. I suppose that falls into the Famous Last Word senario.
All the voltages seem to be ok. So as it stands I still have very low audio and the spurious signals.

Can anyone help or suggest what might or not be happening.

Thanks, Norm

Norm,

Try setting up the transmit side - BFO and TX bias, check to see if you get any RF power out. If so the problem is in one of the receive stages, if not then its in a common stage - mixer, filter etc.

The hiss is definitely from the audio amp and nothing else. The problem also affects the CW adapter kit, although it does not seem quite as bad as the radio kit in my case. Probably some of the problem is down to component variation.

The radio kit is now boxed up, with an internal speaker and set of batteries.

Upon completion of the CW adapter kit, it was realised that perhaps the better combination would have been to squeeze the CW kit into the radio box and have another box for batteries and a speaker. Oh well - gotta figure out a way to nicely route power from the radio to the cw kit - the other way around for which it was designed! (doh)

Dan.

If anyone is in the same situation as myself - you have internal batteries and speaker in the radio and not the cw unit then if you connect a 4.7R 2 watt resistor between the - battery connection and ground then you will be able to use rechargables (this will charge at a rate of 100 - 150mA) and the CW unit will run off the power from the radio unit. Admittedly, the CW unit is running through the 4.7R resistor when on battery power, but this does not seem to have any effect on the CW unit performance.

In my CW unit I have installed a speaker that is larger and better than the one I could fit in the radio unit. This allows the use of the CW filter etc and improves the output when the unit is used.

Dan.

1010. Expanding resources

Yahoo group: mkars80
Date: 2009-07-28 17:55:38 UTC
From: trygvesjothun
Topic: 1010 Message: 1010

Hi, I'm Tryg. I originally was licenced in 1986 but "stuff" came along and it has taken me until quite recently to get my feet back in the water. Though there is still some gear in the "shack" (boxes under a bed!) qrp is of great interest to me and I hope to order a kit soon.

I am fascinated by the sheer functionality of the mkars80. I'm already putting an enclosure together for it. My aim is for DX using kite antennae - CW and PSK31, maybe even SSTV. My QTH is on the Atlantic Coast of Ireland. I'd love to give it a go when I get my licence again (in process).

My humble request. ..given that there is nothing to be found of a video nature on the web (afaik) could someone please shunt up a video to look at the unit in operation. This would be of immense help to show the capabilities of the mkars80 to a number of people at one time. I look forward to posting about my experiences with this cool little rig. I can't wait. Cheers and 73's Tryg

Unfortunately I don't have any easy means to record video but if you look in the files section on the Yahoo group web page you wil find a short video that Ron PA0RCL did.

Ok there is an issue with the proposed mod, once this is resolved I'll describe the extra components.

1014. Success!

Yahoo group: mkars80
Date: 2009-07-29 20:12:10 UTC
From: dave_m0mya
Topic: 1014 Message: 1014

Dear All,

Its been about 12 months now since I last posted here, and unfortunately I can't find my original threads to continue them. I would have been 2E0BYA at the time.

I had my MKARS80 all assembled, but it was suffering with low RX audio and no sign of passing audio to the TX stages. I'd got myself a bit stumped. Anyhow, today was a rainy one so I brought out the old kit to see what I could do to fix it. I started by checking all of the connections and reflowing any that looked suspect. Eventually, I stumbled upon one of the small binocular transformers (T6 IIRC) where I had seemingly not done a good job of removing the enamel before soldering it to the board. I desoldered the joints, scratched the wire about a bit with my penknife and resoldered it. Problem solved! I gave all the other toroids the same treatment for good measure.

I have just had my first QSO with it from my home QTH in N.W Worcestershire to a /P operation in Wiltshire. The op informed me that I never went below 5/9+20dB! Finally I get to feel that "first QSO on something I built" feeling that so many have mentioned. Its brilliant!

My firmware is v1.1 - is it feasible to upgrade to 2.4? Would that be an advantage to me? And what of these nets I've seen mention of - are any more likely to be occurring?

Thanks and 73,

Dave M0MYA.

1015. At Last !

Yahoo group: mkars80
Date: 2009-07-29 20:26:51 UTC
From: Master Ice
Topic: 1015 Message: 1015

Hi all.

Another MKARS80 success to report!

At last I finally have my kit up and running (except the metal bashing I'm afraid)
It was a b*gger since I have post-chemo neuropathy in my hands and fingers and if you think winding toroids is hard normally, try doing it when you can't even feel the wire LOLOL!

Anyway it worked straight off and I've been able to hear several QSOs even through the local 80M qrm.

The transmit side was aligned and tested using a large bulldog clip as a temporary heatsink on the PA and now all I have to do is bash and cut the metal into something resembling the case.

All in all I loved building the kit and already have plans afoot to modify it to go into a more flash casing.

Thanks to Steve for a brilliant piece of kit.

Slim G4IPZ

1016. Sked 9:30AM Sunday 2nd August 3.690 MHz +/- QRM

Yahoo group: mkars80
Date: 2009-08-01 07:03:22 UTC
From: Steve Drury
Topic: 1016 Message: 1016

I will try and hold a sked tomorrow (Sunday 2nd) from about 9:30am, as always we will use the frequency of 3.690MHz ? QRM and other nets.

Last weeks sked broke apart due to band conditions, lets hope they are better tomorrow! I will be based at Bletchley Park where we have a special event "Radio-Waves" see http://www.bletchleypark.org.uk/news/docview.rhtm/587616

My call G6ALU/P will be used.

Last week call signs heard (but not nesasarily worked) were:

M1CXK
M1EEL
G3ZSV
G4MDR
G7HSA

1020. Re: Success!

Yahoo group: mkars80
Date: 2009-08-02 19:50:08 UTC
From: dave_m0mya
Topic: 1014 Message: 1020

Dear All,

Since the previous post Steve has very quickly sorted me out for the VFO mod and new firmware.

I took the new radio out for its first SOTA activation today. I gave it about 10 mins to warm up, broke the huff and puff lock, retuned, and it stayed merrily on frequency for a good hour of long-over operating! Very stable and very enjoyable to use. I have had many reports of good audio, even people asking what microphone I am using! 7 contacts around the UK, and something interesting to tell them all.

Next stop is an absorptive SWR bridge so I can use it with my W3EDP and tuner. I may try to incorporate this into the radio its self.

73,

Dave M0MYA.

From: absorbentgnome
Topic: 1003 Message: 1021

A one ohm resistor connected between the - battery pad and ground with a low dropout schottky diode (3A) in parallel with it with the cathode connected at the - battery pad end gives the required performance for my arrangement. 12 AAA Nicad cells are used in my radio, initially I used 10 AAA cells however the voltage dropped too much under TX load to give a decent amount of RF power. To charge the batteries a 16V dc supply is required. On external power at 16V, the radio will generate 8-10W of RF. On battery power it will generate 5W. Power from the internal cells can be drawn via the power socket for any external units. The diode allows a decent voltage and current flow when a jack is plugged in to power the external CW unit and the radio itself when external power is disconnected (opening the switch in the jack).

I had also added an LCD backlight using a high intensity green LED connected to the 5V supply on the LCD unit. This draws approximately 30mA, so there is slightly more heating of the 5V regulator, however the heat generation is well within the capability of the device.

Dan.

Dan,
Does heating caused by the 5V regulator make warm up time or drift any worse?

Please be careful when playing with Nicad or NiMH cells - I've seen some nasty burn-ups caused by short circuits and split cells caused by over-charging.

A little more success with the sked this week, good signals were heard from:

M1EEL - Mick, Kent
G7HEU - Steve, Wroughton
G3ZSV - Glyn, Plymouth
G7HSA - Adrian, Leatherhead
M1CXK - Alan, Dartford

Interesting to see all were to the South of Milton Keynes, I will hold another sked this Sunday - same time, same place.

Steve G6ALU

I'd guess that length would match the size of knobs used on the original design. If you wanted to use different knobs, the internal length may be different so the shafts would need to be cut to the appropriate length to match.

Re last Sunday's sked:

My MKARS80 is recently finished and I have not had much opportunity to use it. During Sunday's net I appeared to receive better signal reports than I was sending - to the extent that I wondered if I had a slight problem with the MKARS80 or perhaps it was working but just lacking sensitivity.

I left the net and listened on my main rig and was, (perversely?), delighted to learn that received signals were pretty low there too. In other words the MKARS80 was doing a great job and it was just conditions that were against me.

I need to get mine in a box and use it more...

Steve / G7HEU.

Thanks Jon, thats what I meant but probably not put too well!

For the knobs I supply as an option 18mm is OK.

1028. Sunday Sked - 3.690MHz @ 9:30 local time

Yahoo group: mkars80
Date: 2009-08-09 09:28:25 UTC
From: Steve Drury
Topic: 1028 Message: 1028

Quite a few stations this week:

G8JWT - Roger, Stoke Goldington Bucks
G4MDR - Alan, Newport Pagnel Bucks
M0MYA - Dave, Kiderminster
G7HSA - Adrian, Leatherhead
G3UD - Graham, Stoke on Trent
M1CXK - Alan, Dartford
M1EEL - Mick... heard briefly

Probably the largest number of participants so far - I intend holding the sked at the same time and frequency next week (3.690MHz @ 9:30 summer time), my call will be GB2MKM.

Steve G6ALU

Hi Steve and all.
I listened to your sked this morning on my MKARS80 from up here in Northumberland for a good three quarters of an hour. Signals weren't particularly good but I copied about half of the stations you listed.
Dave M0MYA and Graham G3UD were the strongest, Steve G6ALU, you were next best but solid, then Alan G4MDR, and then others who were just about audible here.
I called in several times on a very low end fed wire with my 5 watts but I didn't really expect to make it from here. If you were all running QRP and MKARS80s then you are all doing well. Will try again next week so 73 fer nw de Charles G3OTH

Don't drill any hles Richard they are all there - or should be in any case!

Look at the solder side of the PCB, with the controls towards the bottom you will see a 2.5mm hole in the top left corner.

Come back to me if you are unsure and I will send you a photo.

1032. Low sensitivity

Yahoo group: mkars80
Date: 2009-08-09 20:25:43 UTC
From: pa3ecn
Topic: 1032 Message: 1032

Hello All,

are the any known common faults that result in low sensitivity?
Last week I connected my just finished MKARS80 to a dipole and heard severals station but very weak. Any tips on fault finding are welcome ...
I still have to mount Q1 and do the transmitter aligment.
Thanks!

Eric,

First measure all the transistor voltages and compare against the voltage chart in manual. If this doesn't point to a problem make sure ALL the mixer transformers have their wires soldered properly; if your iron is not hot the insulation may not be removed.

Hope this helps,
Steve G6ALU

From: pa3ecn
Topic: 1032 Message: 1034

Hello,

thanks for the reply Steve.
I found the problem around Q15. Q15 is the transistor/amplifier before the crystal filter and that explains the low sensitivity. The problem was a reversed mounted diode D8.
Sensitivity now seems normal.

Thanks for the help!

1035. Re: Anti hiss mod for MKARS80 audio amp

Yahoo group: mkars80
Date: 2009-08-10 11:48:11 UTC
From: absorbentgnome
Topic: 1003 Message: 1035

While I have not made any quantative measurements, it does seem that the vfo stability is not greatly affected by the additional heating from the regulator. It has affected battery life though - so I may remove it or add a small mod so that the backlight is turned on and off by the pic. The huff and puff does an excellent job of stabilising the receiver, even when transmitting a constant carrier for some time.

The battery charging circuit works fine in my arrangement, the charging current levels off to a low value when fully charged using a charge voltage of 16 to 16.5V and there is only slight heating of the cells when left on charge for an extended period.

It must be noted of course that the one ohm resistor would not provide protection against overcharging if the supply voltage was increased. It was chosen to allow charging from a supply that was limited in its maximum voltage. A cell in a charger can reach 2.5V across it, which would not be very good for the transceiver (12*2.5=30V!)

I have finished my QRP portable station now, I'm waiting for the camera battery to charge and I'll post some photos on the group.

Dan.

1037. MKARS80 CW adaptor

Yahoo group: mkars80
Date: 2009-08-10 13:04:04 UTC
From: John
Topic: 1037 Message: 1037

Hello All,

I completed the MKARS80 CW adaptor some time ago and have been using it in PCB form all that time, it works very well indeed. Finally, I have now cased it and will post some photos on the group should anyone be interested.

I decided to use the same case as the MKARS80. Adaptor and keyer controls are mounted on the long edge panel with the MKARS80 siting on top. To keep all control's together I have the keyer speed control in line with the other controls. A speaker in the CW adaptor case will be used for RX on MKARS80 saving carting around an extension one.

73 de John (M0TIF) ...- .-

1039. Photos of my MKARS80 portable station up

Yahoo group: mkars80
Date: 2009-08-10 15:30:54 UTC
From: absorbentgnome
Topic: 1039 Message: 1039

Just a quick note to say the photos of my station are in the photo gallery.

The radio has an internal speaker and 12 AAA NiMH batteries fitted.
The CW unit is fitted into the same style case as the radio, with a larger upwards facing speaker inside and all controls on the front so that it is all accessible when stacked. A nice big desk mic has been modified to work with it. A windom antenna with choke, 4:1 balun and feeder has been made to go with it. The mic has had a 3.5mm socket fitted so that audio from the computer can be transmitted for digital modes and the headphone socket on the cw unit is used for input into the computer.

Dan.

Hello Dan,

Thanks for the pictures, very nice job, we have chosen almost the same design for cw adaptor case and posted pictures at the same time! Hpe to wrk u CW on MKARS80 some time.

Hi thanks John I'll have a look in the gallery at your photos.
Did you have lucky placement so that the electronic keyer battery just fitted between two electrolytics on the adaptor board? ;)
I fitted it all in without the battery then noticed later upon final assembly!
Dan.

Had a look at your arrangement, its different so you probably won't have had that 'lucky miss' of board and component arrangement. Looks like a tidy job. I will have to get some acetate and a program suitable for making some decent front panels and labels.

Learning CW at the moment, haven't got anyone to practice with so if you or anyone else knows someone who wants to learn and have some slow practice qso's (heh preferably on an MKARS80) then please get in touch.

I am hoping someone can help me please,
The radio has been running for a couple of months on rx but i only tried tx on it the other day with a local chap.
It sounds awful so i am told and it can't be resolved into clean audio.

I have checked the usual joints etc but i have come up against a wall any ideas greatfully recieved.

What type of microphone are you using? I tried an electret mic out of a handsfree kit and a dynamic studio mic. The dynamic mic was terrible, level was too low, audio too bassy. The electret one was excellent though, gave real good punch where its necessary. Can you monitor it on another receiver to hear it? I use headphones on the receiving unit to prevent feedback.

Pete,
Has it been set up as per the manual, there are 3 important adjustments:
1.. BFO frequency - if possible set it up for 10MHz at TP10MHz - maladjustment could cause muffled audio on TX.
2.. Output transistor bias - adjust for a 50mA increase in current whilst in TX mode, see the manual for full instructions - too little current (not adjusted) will cause horrible distorted audio.
3.. Mixer null adjustment - this is adjusted to reduce the carrier to a minimum - again see the manual. Maladjustment will cause a "whistle" on your transmission if tuned slightly off frequency.

Hi Steve,
yes it has been set up as the manual using test equipment at work i.e scope, and spectrum analyzer for the 10MHz test point (i don't trust the workks frequency counter).

Although i spend most of my time tunning tx and rx modules i must admit i struggled a bit with the mixer null adjustment and so did my collegue. although i will try again tomorrow.

thanks Pete G7VHJ

Sorry i should have said i am using an electret mike and i have tried a few just to see if they make any difference, and to me it sounds ok using both a scanner and receiver when in close range it seems to be worse with a bit of distance (50 feet) or so.

regards Pete G7VHJ

Topic: 1039 Message: 1051

Hi Dan and John, I enjoyed looking at your photos of your CW adapter assemblies in the Photo Gallery, I think I may also go down the route of using one of Steve's MKARS80 cases to package my adapter now that you have shown how it could be done. My PCB assembly is still in one piece here as I didnt want to separate the 3 boards out until I had decided how I was going to package them. Having seen your photos I have no excuse now and have finally decided that I will keep the autokeyer with the rest of the CW adapter rather than package it in a separate box. Only one comment Dan I noticed that the displayed voltage from presumably your 12 fully charged NiMH cells was much more than I would have been comfortable with, so hope you get away with it ok. I had been thinking more in terms of using a bank of 10 but their volts do get a bit lower than perhaps is desirable when nearly discharged. Have you thought of perhaps using a relatively larger resistor between the bank of 12 cells and your charging source so that the cells can be on permanent trickle charge, and using an emitter follower power transistor with base connected to the cells, its collector to the external charging source and emitter to the MKARS80 and CW adapter etc power rail. This way you loose a Vbe drop from the cells which is a good thing, but still allow the cells to safely trickle charge, and also allow most of the current available from the charging source to drive the Radio at a safe voltage via the transistor when in use, but will also allow maximum current to be drawn from the cells when the charger is removed. As an example a 47 ohm 1 watt resistor would provide say a 100mA trickle charge for a voltage drop of about 4.7 volts between say a 20 volt charging source and your 15.3 volt nominal battery and any 10 watt 2 Amp NPN power transistor screwed to the case would be happy to provide current to the Radio when used.

Hi Steve,
iv'e been told that the audio is very "wooly" sounding and the chap i was trying to talk to told me that he couldn't resolve the audio by checking either side of the frequency that we were on.

I am confident that the radio is setup at 10Mhz as the spectrum i use is callibrated, the frequncy counter i have at work is only slightly off but not callibrated.

and the current increase was checked with a shorted plug to create the tx and psu and dmm used in conjuction with each other to confirm the increase
thanks again Pete

Does the spectrum analyser have a frequency counter?

Another question:

Tune across a strong heterodyne (CW tone); if you tune low in frequency past the zero Hz point do you then hear the tone come up in frequency?

Steve G6ALU

Yes to the first question and i haven't tried the second option yet but all seems to work as i would expect it too

Hi Charles

I tried 10 cells, but the voltage dropped too much on transmit and resulted in low power output. Once the cells started to discharge the voltage dropped further and output power even lower, so from my experience I would not try 10 cells.

The upper voltage limit is 16V, I run it at 16 to 16.5. Will caps blow up? Time will tell i suppose - but you do get a very healthy power output at 16V ;)

Good idea with the emitter follower.

I found that even the slightest voltage drop limited output power quite a lot, so wanted to avoid as little vdrop as possible.

I am wondering if the voltage across the cells is enough to charge them fully. If it is not, then I will implement your suggestion.

Thanks
Dan

> Hi Dan and John, I enjoyed looking at your photos of your CW adapter assemblies in the Photo Gallery, I think I may also go down the route of using one of Steve's MKARS80 cases to package my adapter now that you have shown how it could be done. My PCB assembly is still in one piece here as I didnt want to separate the 3 boards out until I had decided how I was going to package them. Having seen your photos I have no excuse now and have finally decided that I will keep the autokeyer with the rest of the CW adapter rather than package it in a separate box. Only one comment Dan I noticed that the displayed voltage from presumably your 12 fully charged NiMH cells was much more than I would have been comfortable with, so hope you get away with it ok. I had been thinking more in terms of using a bank of 10 but their volts do get a bit lower than perhaps is desirable when nearly discharged. Have you thought of perhaps using a relatively larger resistor between the bank of 12 cells and your charging source so that the cells can be on permanent trickle charge, and using an emitter follower power transistor with base connected to the cells, its collector to the external charging source and emitter to the MKARS80 and CW adapter etc power rail. This way you loose a Vbe drop from the cells which is a good thing, but still allow the cells to safely trickle charge, and also allow most of the current available from the charging source to drive the Radio at a safe voltage via the transistor when in use, but will also allow maximum current to be drawn from the cells when the charger is removed. As an example a 47 ohm 1 watt resistor would provide say a 100mA trickle charge for a voltage drop of about 4.7 volts between say a 20 volt charging source and your 15.3 volt nominal battery and any 10 watt 2 Amp NPN power transistor screwed to the case would be happy to provide current to the Radio when used.

Hello Dan,

I have the lithium battery mounted off the board as indeed it touched some of the components on the adaptor board, I also mounted the speed control off board so its in line with other controls other than that we have about the same design.

OK on the Morse practice I wish you all the success with that, I one bit of advice I would give is do 15 mins of practice a day EVERY DAY using whatever practice method suites you. I know we all lead busy lives but I am sure one can squeeze in 15 mins a day, it really will pay off. There are many systems to practice with its a case of choosing one that suits you best, a couple of suggestions are: the free web based www.Icwo.net which is excellent or NuMorse (Google it) there is a charge for this package to enable more features. Also start reading car number plates and advertising boards etc in CW in your head. You may find a few locals also learning CW maybe get together with them at your local club for some encouragement.

Good luck

John (M0TIF)

From: absorbentgnome
Topic: 1039 Message: 1058

I had the radio open this morning so had a look at the caps. The lowest voltage rating cap in my unit is 25V.

Increased voltage will have greater dissipation in the regulators. Currently with the backlight LED the dissipation is OK.

The relay coil will heat more at 16V on tx. Is this a problem? Unsure. There will be increased dissipation on all the transistor circuits connected to RX/TX12V.

A continuous TX at full power at 16V leads to heating of the transformer in the final and the filter inductors. I have a small amount of hot glue on each inductor/transformer to fix it to the board. From several continuous output TX tests at 10 minutes the glue has clearly softened and moved. The components are unsuitable for 100% duty cycle at 16V, perhaps I have been overdriving a little and introducing distortion?

Some more poking around had shown that Q5 is dissipating a fair amount of heat in my radio. Reducing the voltage to 13.8V still results in the device getting hot enough to hurt my finger. I have checked the components and found no mistakes, maybe a problem with T1?
The symptom of this is under TX, when driving the final into saturation such that the LED extinguishes, as time goes by and Q5 heats, the mod LED will gradually light up.

In the meantime I have fashioned a copper heatsink to dissipate the heat. Has anyone else found Q5 to heat considerably?

Dan.

Fine Dan about your findings using 10 cells.
I have just read your earlier postings again and see that you are using AAA types, rather than the AA type which I had thought you were using. In this case if you were to try using my idea I would reduce the trickle charge to 50 mA or so by using say a 100R 1/2 watt resistor. For Nicads I used to use the old rule of thumb of not exceeding 1/10 of mAmpHr rating of cell for continuous trickle charge, but dont know if this still applies to NiMH cells as well. The AA NiMH cells I have here vary from 1800 mAHr to 2500 mAHr depending on their manufacturer, which if so would imply that you could get away with using up to 180mA continuous trickle for them.
Apart from the ratings of the electrolytic caps you mentioned, also remember that the LM386N-1 that Steve supplies has an absolute max voltage supply rating of 15 volts and max operating voltage supply rating of 12 volts according to the National Semiconductors Data sheet, although I am not sure what other manufacturers claim. To be on the safe side particulary if you are also using low ohm speakers you might consider using a LM386N-4 which Doug Hendricks supplies in his BITX20A kit and is rated at up to 22 volts absolute and 18 volts operating respectively. These ICs however dont seem to be stocked by Maplins, Rapid, QRP club etc. so you might have to look father afield for them. Saying that I havent checked out the specs for the PIC and LCD so there could also be issues there using higher voltages.
Something more tro consider and keep an eye on.

My PCB assembly is still in one piece here as I didnt want to separate the 3 boards out until I had decided how I was going to package them. Having seen your photos I have no excuse now and have finally decided that I will keep the autokeyer with the rest of the CW adapter rather than package it in a separate box. Only one comment Dan I noticed that the displayed voltage from presumably your 12 fully charged NiMH cells was much more than I would have been comfortable with, so hope you get away with it ok. I had been thinking more in terms of using a bank of 10 but their volts do get a bit lower than perhaps is desirable when nearly discharged. Have you thought of perhaps using a relatively larger resistor between the bank of 12 cells and your charging source so that the cells can be on permanent trickle charge, and using an emitter follower power transistor with base connected to the cells, its collector to the external charging source and emitter to the MKARS80 and CW adapter etc power rail. This way you loose a Vbe drop from the cells which is a good thing, but still allow the cells to safely trickle charge, and also allow most of the current available from the charging source to drive the Radio at a safe voltage via the transistor when in use, but will also allow maximum current to be drawn from the cells when the charger is removed. As an example a 47 ohm 1 watt resistor would provide say a 100mA trickle charge for a voltage drop of about 4.7 volts between say a 20 volt charging source and your 15.3 volt nominal battery and any 10 watt 2 Amp NPN power transistor screwed to the case would be happy to provide current to the Radio when used.

Fine Dan about your findings using 10 cells.
I have just read your earlier postings again and see that you are using AAA types, rather than the AA type which I had thought you were using. In this case if you were to try using my idea I would reduce the trickle charge to 50 mA or so by using say a 100R 1/2 watt resistor. For Nicads I used to use the old rule of thumb of not exceeding 1/10 of mAmpHr rating of cell for continuous trickle charge, but dont know if this still applies to NiMH cells as well. The AA NiMH cells I have here vary from 1800 mAHr to 2500 mAHr depending on their manufacturer, which if so would imply that you could get away with using up to 180mA continuous trickle for them.
Apart from the ratings of the electrolytic caps you mentioned, also remember that the LM386N-1 that Steve supplies has an absolute max voltage supply rating of 15 volts and max operating voltage supply rating of 12 volts according to the National Semiconductors Data sheet, although I am not sure what other manufacturers claim. Topic: 1039 Message: 1062

Ok Charles
All noted on the LM386.
A long time ago I had a 5A power supply, I took the lid off and had a look inside. I discovered the smoothing caps were rated below the unloaded rectified voltage! Some more poking around revealed a 555 timer chip which had 4V more across it than the datasheet's max rating. You would have thought the PSU would not have been very reliable ... but amazingly its still going to this day!
My main worry at the moment is heat dissipation in Q5. Some heatsinking has temporarily fixed the symptoms, but not the problem.

Yes you are correct Charles - this is something I have gambled on since day one but so far its been OK, even when abused they seem to survive OK! Note I have a 4R7 in series which helps with a small voltage reduction but 15V is perhaps chancing it a little.

If it fails I will send you a new one - we will know what the limit is!

Steve G6ALU

In this case if you were to try using my idea I would reduce the trickle charge to 50 mA or so by using say a 100R 1/2 watt resistor. For Nicads I used to use the old rule of thumb of not exceeding 1/10 of mAmpHr rating of cell for continuous trickle charge, but dont know if this still applies to NiMH cells as well. The AA NiMH cells I have here vary from 1800 mAHr to 2500 mAHr depending on their manufacturer, which if so would imply that you could get away with using up to 180mA continuous trickle for them.
>> Apart from the ratings of the electrolytic caps you mentioned, also remember that the LM386N-1 that Steve supplies has an absolute max voltage supply rating of 15 volts and max operating voltage supply rating of 12 volts according to the National Semiconductors Data sheet, although I am not sure what other manufacturers claim. To be on the

safe side particulary if you are also using low ohm speakers you might consider using a LM386N-4 which Doug Hendricks supplies in his BITX20A kit and is rated at up to 22 volts absolute and 18 volts operating respectively. These ICs however dont seem to be stocked by Maplins, Rapid, QRP club etc. so you might have to look father afield for them. Saying that I havent checked out the specs for the PIC and LCD so there could also be issues there using higher voltages.

My PCB assembly is still in one piece here as I didnt want to separate the 3 boards out until I had decided how I was going to package them. Having seen your photos I have no excuse now and have finally decided that I will keep the autokeyer with the rest of the CW adapter rather than package it in a separate box. Only one comment Dan I noticed that the displayed voltage from presumably your 12 fully charged NiMH cells was much more than I would

have been comfortable with, so hope you get away with it ok. I had been thinking more in terms of using a bank of 10 but their volts do get a bit lower than perhaps is desirable when nearly discharged. Have you thought of perhaps using a relatively larger resistor between the bank of 12 cells and
> your charging source so that the cells can be on permanent trickle charge, and using an emitter follower power transistor with base connected to the cells, its collector to the external charging source and emitter to the MKARS80 and CW adapter etc power rail. This way you loose a Vbe drop from the cells which is a good thing, but still allow the cells to safely trickle charge, and also allow most of the current available from the charging source to drive the Radio at a safe voltage via the transistor when in use, but will also allow maximum current to be drawn from the cells when the charger is removed. As an example a 47 ohm 1 watt resistor would provide say a 100mA trickle charge for a voltage drop of about 4.7 volts between say a 20 volt charging source and your 15.3 volt nominal battery and any 10 watt 2 Amp NPN power transistor screwed to the case would be happy to provide current to the Radio when used.

1064. Re: Photos of my MKARS80 portable station up

Yahoo group: mkars80
Date: 2009-08-11 11:57:05 UTC
From: absorbentgnome
Topic: 1039 Message: 1064

Hi Steve

If anything fails its likely to be my own (stupid) fault, so any replacements I will source myself but thankyou for the support!

Have you experienced any heat problems with the Q5 driver before? I am getting significant heating at 13.8V, at higher the heating is even worse.

Dan.

From: g3oth
Topic: 1039 Message: 1065

Dan I am not sure quite what is going on with Yahoo this morning, as I see that one of my messages has been triplicated and a reply I posted to you earlier has not yet been listed.
As far as Q5 is concerned I have not noticed any undue heating here, although I have usually kept my supply at 12 volts so cant say what would happen should I go higher.
I havent noticed any thermal runaway at this voltage in so much that the LED behaves itself pretty well and the quiescient current does not vary much over a long session.

> The relay coil will heat more at 16V on tx. Is this a problem? Unsure. There will be increased dissipation on all the transistor circuits connected to RX/TX12V.
>
> A continuous TX at full power at 16V leads to heating of the transformer in the final and the filter inductors. I have a small amount of hot glue on each inductor/transformer to fix it to the board. From several continuous output TX tests at 10 minutes the glue has clearly softened and moved. The components are unsuitable for 100% duty cycle at 16V, perhaps I have been overdriving a little and introducing distortion?
>
> Some more poking around had shown that Q5 is dissipating a fair amount of heat in my radio. Reducing the voltage to 13.8V still results in the device getting hot enough to hurt my finger. I have checked the components and found no mistakes, maybe a problem with T1?

From: g3oth
Topic: 1039 Message: 1066

FB Steve, well I dont think we have anything to worry about if we keep to below 15 volts. Also I have noticed it takes a really strong signal to get the output of the 386 to swing to its limit, most of the time for comfortable listening the output volts on pin 5 seen on a scope change very little, so even when using a 4 or 8 ohm speaker average dissipation is not likely to be a problem and the fact that the chip itself barely gets warm is witness to that. When I first was introduced to a ISA PC sound card in the early 1990s I couldnt believe how they managed to get so much audio out from such a small unheatsunk device! Nowadays however finding a PCI soundcard that will drive an unpowered speaker directly is a rarity.

Topic: 1039 Message: 1067

Uploaded a few new photos of internals, you can see the heatsink added to Q5 at the bottom left of the picture of the circuit board.

Dan.

>
> FB Steve, well I dont think we have anything to worry about if we keep to below 15 volts. Also I have noticed it takes a really strong signal to get the output of the 386 to swing to its limit, most of the time for comfortable listening the output volts on pin 5 seen on a scope change very little, so even when using a 4 or 8 ohm speaker average dissipation is not likely to be a problem and the fact that the chip itself barely gets warm is witness to that. When I first was introduced to a ISA PC sound card in the early 1990s I couldnt believe how they managed to get so much audio out from such a small unheatsunk device! Nowadays however finding a PCI soundcard that will drive an unpowered speaker directly is a rarity.

From: Steve Drury
Topic: 1039 Message: 1068

Q5 will get very warm (hot!) as its running in class A with a reasonable quiescent so will be near its maximum ratings at 13.8V - you may be pushing it beyond them but as yet I haven't had to replace one.

The fact that its "wilting" with the heat does suggest its life will be limited, keeping its leads short will help as most of the heat will be disipated into the PCB.

Steve G6ALU

Ok Steve
The heatsinking has stopped the 'wilting' completely so will leave as is. I'll let the group know if anything goes bang :)
Thanks for the info on Q5. Those ZTX transistors are quite hardy I've seen them run very hot in other equipment too.
Dan.

From: dagmine
Topic: 1070 Message: 1070

Anyone done any mods to use one of these on 40 meters? Any plans for a 40 meters version in the near futur?

1071. Re: [mkars80] 40 Meters??

Funny you ask,

Tried a MKARS40 out today, first contacts were DL and PA...

There is a problem in that the filter bandwidth far too wide, if this can be sorted then I will offer it for sale. It won't be offered as an upgrade though as there is too much danger in damaging the PCB when you change all the components.

If it uses the same PCB, I would like a component kit when ready. Last year I purchased two PCBs hoping to source the components here. That takes way to much time I don't have. So if possible if and when the kit is ready I would like to purchase the components only.

Have you seen the awesome job G8EEY did on his MKARS80. Sure wish he would to a full write up on that one.

Which filter is too wide--the RF LPF or the IF crystal filter? If the xtal filter, what IF frequency are you using for the 40M version?

Yes, it looks very nice!

If (hopefully when) a kit is available I will sell just the component packs - I intend it to use exactly the same PCB.

Crystal filter, I've set it at 12MHz but haven't yet done any development on
it.

Steve, please refresh my memory, I wonder what prompted you to change the IF and go to 12 MHz to cover 40 meters rather than retain 10 MHz and just use a lower VFO range ?
I can't remember now if you have covered this before in earlier posts,
VFO harmonics and mixing products ring a bell, or was that connected with using a 9 MHz IF.
Apologies for bringing this up agn if the answer was covered already and lies elsewhere.
73 de Charles G3OTH
P.S. Will try and get on the net tomorrow at 9.30 if condx allow.

From: Steve Drury
Topic: 1070 Message: 1078

Main problem I thought was with a 10MHz IF the VFO would have to run at 2.8 - 3MHz, the second harmonic at 6MHz may be hard to filter out of the TX spectra. I may be wrong though so might be worth another visit as it looks like the 10MHz IF is superior to 12MHz.
